

PREFACE

This methodological guide is designed for first-year students of the Faculty of Computer Science within the English Language Education Project which is being implemented now at the National Aviation University.

The purpose of the guide is to facilitate students mastering the special terminology when studying computer disciplines in the English language, on the first hand, and to enhance students' knowledge of the language, on the other.

The guide begins with the base text "Modern Computers" so exhaustively elaborated with a system of exercises that the authors had to divide it into two parts. Each part of the text is preceded by a group of exercises built on the basis of the speech patterns that are met in this part of the text. After the text, another group of exercises aimed at both enhancing special knowledge and improving language skills is given.

Besides, the guide contains texts on separate types of computers that are widely used nowadays. The texts are taken from original sources. Each text is followed by a detailed vocabulary, with the words arranged in the order of occurrence in the text. A diverse system of exercises that is presented after each text is conducive to developing lexical, grammar, and communicative habits and skills.

The grammar exercises cover various grammar occurrences and go in the order of their appearance in the text, but largely they are devoted to the modal verbs, which is provided for in the curriculum.
