# MINISTRY OF EDUCATION AND SCIENCE OF UKRAINE NATIONAL AVIATION UNIVERSITY

Faculty of Transport, Management and Logistics Department of Higher mathematics

# METHODICAL GUIDANCE TO THE STUDENTS' SELF-STUDY

on «Higher Mathematics»

Field of study:13 «Mechanical engineering»Specialty:134 «Aviation and Space Rocket Techniques»Educational and Professional Program: « Aircraft Equipment »

Developed by: Senior lecturer V. Kravchenko Metodical guidance to the students' self-study was considered and approved by the meeting of the Higher Mathematics Department, Minutes № \_\_\_\_ of \_\_\_\_2021

Head of Department\_\_\_\_\_I. Lastivka

#### METHODICAL SUPPORT OF ARRANGEMENT OF STUDENTS' SELF-STUDY

- 1. Higher mathematics. Part 1: Manual/ Denisiuk V.P., Grishina L.I., Karupu O. V., Oleshko T.A., Pakhnenko V.V., Repeta V.K. Kyiv: NAU, 2006. 272 p.
- 2. Higher mathematics. Part 2: Manual/ Denisiuk V.P., Demidko V.G., Repeta V.K. Kyiv: NAU, 2009. 248 p.
- 3. Higher mathematics. Part 3: Manual/ Denisiuk V.P., Grishina L.I., Karupu O. W., Oleshko T.A., Pakhnenko V.V., Repeta V.K. Kyiv: NAU, 2006. 232 p.
- 4. Higher mathematics. Part 4: Manual/ Denisiuk V.P., Bobkov V.M., Grishina L.I., Demidko V.G., Karupu O. V., Oleshko T.A., Pakhnenko V.V., Pogrebetska T.O., Repeta V.K. Kyiv: NAU, 2006. 248 p.

# Module №1 " Elements of Linear Algebra, Vector Algebra and Analytical Geometry. Complex Numbers."

#### **Topic 1. 1. Elements of Linear and Vector Algebra**

#### 1. Concepts, definitions, formulations:

- 1. Determinants of the 2nd, the 3rd and the n-th orders.
- 2. Matrices. Linear operations with matrices. Multiplication of matrices.
- 3. Inverse matrix
- 4. Definite, indefinite, consistent, inconsistent SLAE.
- 5. Matrix form of SLAE.
- 6. Gauss' method of SLAE solution.
- 7. Kronecker-Capelli theorem usage in SLAE investigation.
- 8. Geometrical vector. Vector addition and subtraction operations, multiplication by scalar.
- 9. Linear dependence and independence of vectors.
- 10. Cartesian coordinate system (CCS).
- 11. Dot product of two vectors.
- 12. Cross product of two vectors.
- 13. Triple product

#### 2. Proofs and conclusions

- 1. Properties of determinants (2nd and 3rd orders).
- 2. Matrix addition and multiplication properties.
- 3. Existence of an inverse matrix.
- 4. Inverse matrix method of SLAE solution.
- 5. Cramer's Theorem.
- 6. Kronecker-Capelli Theorem.

- 7. Projection of vector on axis.
- 8. Representation of a vector in terms of base vectors.
- 9. Properties of a dot product; calculation by coordinates.
- 10. Properties of a cross product; calculation by coordinates.
- 11. Properties of a triple product; calculation by coordinates

#### 3. Assignments

1. Calculate the determinants of order 2, 3 and *n*, to be able to lay out a determinant by the elements of any row or column, to reduce determinant to the triangle form.

- 2, Find the matrix sum, difference and product.
- 3. Find the matrix rank.
- 4. Find an inverse matrix.
- 5. Solve the square systems by Cramer's method, through inverse matrix.
- 6. Solve the square systems by Cramer's method, through inverse matrix.
- 7. Solve the arbitrary SLAE by Gauss' method.

8. Analyse SLAE on the consistence (compatibility) according to Kronecker-Capelli Theorem.

9. Analyse SLAE on the consistence (compatibility) according to Kronecker-Capelli Theorem.

10. Find the eigenvalues and eigenvectors of matrix.

- 11. Find the vector coordinates, it's length, unit vector. Find the angle between vectors.
- 12. Find the vector sum, difference, dot and cross products.
- 13. Calculate the area of the triangle, volume of pyramid.
- 14. Be able to represent the vector in terms of base vectors.
- 15. Be able to use the condition of two vectors perpendicularity

#### **Topic 1. 2. Analytical Geometry**

#### 1. Concepts, definitions, formulations:

1. Different equations of a straight line (typical problems of finding equations of a straight line).

2. Curves of the second order: a circle, an ellipse, a hyperbola, a parabola (their standard equations).\*

3. A plane. Different equations of a plane (typical problems on finding of equations of a plane).

4. Cylindrical, conic surfaces.

5. Surfaces of revolution.

6. Method of sections.

#### 2. Proofs and conclusions

1. Different forms of the equation of a straight line on a plane (general, symmetric, parametric, passing through two points, in slope — intercept form, in «segments», normal).

2. Mutual location of two straight lines. An angle between two straight lines. Conditions of parallelism and perpendicularity.

- 3. Distance from a point to a straight line.
- 4. Equation of a plane passing through a point perpendicularly to a given vector.
- 5. Equation of a plane passing through three given points.
- 6. Equation of a circle, an ellipse, a parabola.

7. Symmetric equations of a straight line in space.

#### 3. Assignments

1. To work out the equation of a straight line passing through two points, through one point in the given direction.

2. To work out equations of a plane passing through a point perpendicularly to a vector, through three points.

3. To find angles between straight lines and planes.

4. To find an intersection point of a straight line and a plane.

5. To reduce equations of the second order to the standard form and to sketch their graphs.

#### **Topic 1. 3. Complex numbers**

#### 1. Concepts, definitions, formulations:

1. Complex numbers.

- 2. Forms of the complex numbers.
- 3. Operations with them

4. Sets. Classification of numerical sets. Operations on sets. The modules of a real number.

5. A sequence.

6. A function. Classification of functions. The elementary functions. An inverse function. A composite function.

7. The Limit of a numerical sequence. The Limit of a function. Infinitesimals.

8. Continuity. Continuity of a function at a point and on an interval. Properties of continuous functions. Points of discontinuity and its classification.

#### 2. Proofs and conclusions

- 1. Complex number.
- 2. Module and argument of a complex number
- 3. Theorems about limits.
- 4. The first and the second honorable limits.
- 5. Theorems about equivalent infinitesimals.

#### 3. Assignments

- 1. Operate with complex numbers
- 2. Evaluate the limits.
- 3. Evaluate the limits using the equivalent infinitesimals.
- 4. Investigate functions for continuity.

# Module No2 " Differential calculus of a function of one variable. Differential calculus of a function of several variables "

Topic 2. 1. Limits

#### 1. Concepts, definitions, formulations:

1. Sets. Classification of numerical sets. Operations on sets. The modules of a real number.

2. A sequence.

3. A function. Classification of functions. The elementary functions. An inverse function. A composite function.

4. The Limit of a numerical sequence. The Limit of a function. Infinitesimals.

5. Continuity. Continuity of a function at a point and on an interval. Properties of continuous functions. Points of discontinuity and its classification.

#### 2. Proofs and conclusions

- 1. Theorems about limits.
- 2. The first and the second honorable limits.
- 3. Theorems about equivalent infinitesimals.

# 3. Assignments

- 1. Evaluate the limits.
- 2. Evaluate the limits using the equivalent infinitesimals.
- 3. Investigate functions for continuity.

#### **Topic 2. 2. Differential Calculus of the Function of One Variable**

#### 1. Concepts, definitions, formulations:

- 1. Definition of a derivative. Geometrical and physical interpretation.
- 2. A table of derivatives. Rules of differentiation.
- 3. A connection between continuity and differentiability.
- 4. A differential. Geometrical interpretation of a differential.
- 5. The usage of the differentials.
- 6. Evaluation of the first and higher order derivatives.
- 7. Leibniz's formula.
- 8. Lagrange's formula.

9. L'Hospital's rule for expansion of indeterminate forms  $\begin{bmatrix} 0\\ 0 \end{bmatrix}$  or  $\begin{bmatrix} \infty\\ \infty \end{bmatrix}$ .

- 10. Taylor's formula.
- 11. Maclaurin's formula.
- 12. Investigation for function increase and decrease on the given interval.
- 13. Investigation of a function for extremum.
- 14. Minimum and maximum values on the interval.
- 15.Concavity intervals. Inflection points.
- 16. Asymptotes.
- 17. Plan of graph construction.

#### 2. Proofs and conclusions

- 1. The derivatives of elementary functions.
- 2. The first order and higher order derivatives of the parametric functions.
- 3. Theorem about continuity of differentiable functions.

4. Geometrical interpretation of the first order differential.

- 5. Equation of a tangent line and a normal to the curve.
- 6. Lagrange's and Fermat's theorems.

7. L'Hospital's rule for expanding of indeterminate form  $\begin{bmatrix} 0\\ 0 \end{bmatrix}$ .

- 8. The necessary monotony conditions.
- 9. The necessary and sufficient extremum conditions.
- 10.Curve asymptotes seeking rule.

#### 3. Assignments

1. Find the derivatives of functions.

2. Find the derivatives of composite functions, implicit functions and parametric functions.

- 3. Find the differentials of functions.
- 4. Find the derivatives and the differentials of higher order.
- 5. Solve tasks for geometrical and physical interpretation of a derivative.
- 6. Investigate elementary functions.
- 7. Sketch the graphs of elementary functions.
- 8. Find different limits with the help of L'Hospital's rule.
- 9. Find intervals of function increase and decrease, local extremum.
- 10. Find concavity intervals.
- 11. Find graph asymptotes.
- 12. Construct the graph.

#### **Topic 2. 3. Functions of several Variables**

#### 1. Concepts, definitions, formulations:

- 1. Functions of several variables.
- 2. Limit, and continuity of the functions of several variables.
- 3. Partial derivatives.
- 4. Differential.
- 5. Relative extrema.
- 6. Tangent plane and normal to a surface.
- 7. Gradient.
- 8. Extrema on a polygon.

#### **2.** Proofs and conclusions

- 1. Functions of several variables. Domain of a function of several variables.
- 2. Properties of continuous of the functions of several variables.
- 3. Formulas for calculation of partial derivatives.
- 4. Differential. Properties and calculation.
- 5. Relative extrema. Necessary and sufficient conditions.
- 6. Tangent plane and normal to a surface.
- 7. Gradient. Properties and calculation.

#### 8. E extrema on a polygon.

#### 3. Assignments

- 1. Finding domain of a function of several variables.
- 2. Finding the first and higher order partial derivatives and the differentials.
- 3. Finding partial derivatives of the composite functions.
- 4. Implicit partial differentiation.
- 5. Finding equations of tangent plane and normal to a surface.
- 6. Finding gradient.
- 7. Finding relative extrema and extrema on a polygon.

#### Module Nº3 " Integral calculus of functions of one variable. "

## **Topic 3. 1. Integral Calculus of the Function of One Variable**

#### 1. Concepts, definitions, formulations:

- 1. Antiderivative. Indefinite integrals. Table of integrals. Evaluating techniques.
- 2. Polynomial functions. Rational functions.
- 3. Integrating of rational functions by partial fractions.
- 4. Integrals involving powers of trigonometric functions.
- 5. Integrating of irrational functions.
- 6. Definite integrals. Newton-Leibniz fundamental theorem.
- 7. Properties of definite integrals. Evaluating techniques.
- 8. Improper integrals. Convergence of improper integrals.
- 9. Application of the definite integrals

## 2. Proofs and conclusions

1. Concepts of antiderivative and the indefinite integral. The table of the integrals.

- 2. The substitution technique.
- 3. Integration by parts.
- 4. Integrating of partial fractions. Integrating of rational functions.
- 5. Integrals involving powers of trigonometric functions.
- 6. Integrating of irrational functions.
- 7. Definite integrals. Newton-Leibniz fundamental theorem.
- 8. Properties of definite integrals.
- 9. Improper integrals. Convergence and evaluating.
- 10. Application of the definite integrals in geometry and mechanics.

#### 3. Assignments

1. Find indefinite integrals applying table of integrals.

2. Find indefinite integrals applying substitution technique.

3. Find indefinite integrals applying integration by parts.

4. Find integrals of rational functions by partial fractions.

5. Find integrals involving powers of trigonometric functions.

6. Find integrals of irrational functions.

7. Find definite integrals applying Newton-Leibniz formula..

8. Find definite integrals applying evaluating techniques.

9. Investigate improper integrals for convergence. Find improper integrals.

10. Apply definite integrals for solving geometric and mechanical problems.

#### Module Nº4 " Differential equations. Series "

#### **Topic 4. 1. Differential Equations**

#### 1. Concepts, definitions, formulations:

1. Differential equations of the first order. General definitions. Integral curve. Cauchy problem.

2. Differential equations of the first order: separable equation, homogeneous differential equation, linear differential equations of the first order, Bernoulli equation, exact differential equations.

3. Differential equations of higher order. Basic concepts and definitions.

4. Differential equations which allow reduction of order.

5. Linear differential equations of order n.

6. Linear homogeneous differential equations with constant coefficients.

7. Linear non-homogeneous equations. Method of undetermined coefficients.

8. Systems of the differential equations. Normal system of differential equations.

The method of elimination and integration combinations of solutions of systems of differential equations in normal form.

9. System of differential equations with constant coefficients.

#### 2. Proofs and conclusions

1. Differential equations of the first order. General and particular solutions of differential equation. Cauchy problem.

2. Separable equation.

- 3. Homogeneous differential equation.
- 4. Linear differential equations of the first order.
- 5. Bernoulli equation.
- 6. Exact differential equations.

7. Differential equations of higher order.

8. Linear differential equations of order n. Fundamental system of solutions. Structure of the general solution of the homogeneous linear differential equation of order n.

9. Method of variation of constants.

10. Linear homogeneous differential equations with constant coefficients. The structure of the general solution of a linear homogeneous equations.

11. Linear non-homogeneous equations. The structure of the general solution of a linear non-homogeneous equations.

12. Method of undetermined coefficients.

13. Systems of the differential equations. Normal system of differential equations.

The method of elimination and integration combinations of solutions of systems of differential equations in normal form.

### 3. Assignments

1. Finding general solutions of the differential equations of the first order: separable equation, homogeneous differential equation, linear differential equations of the first order, Bernoulli equation, exact differential equations.

2. Finding the particular solution of the differential equation through the given point. Linear differential equations with constant coefficients.

3. Finding the most general solution of the simultaneous equations.

4. Some applications of differential equations.

# **Topic 4. 2. Series**

#### 1. Concepts, definitions, formulations:

1. Number series. Principal concepts and definitions.

2. The necessary condition for convergence.

3, Tests for convergence of positive terms series (comparison test, D'Alembert's test, Cauchy's test).

- 4. Alternating series. Leibniz test.
- 5. Absolute and conditional convergence.
- 6. Functional series. General definitions.
- 7. Uniform convergence. Weierstrass' test. Properties of uniformly convergent series. 8.
- 9. Power series. Abel's theorem. Interval and radius of convergence of a power series.
- 10. Taylor's and Maclaurin's series.
- 11. Expansion of a function in a series.
- 12. Applications of the series.
- 13. Trigonometric Fourier series. Fourier coefficients. Dirichlet's theorem.
- 14. Fourier series for  $2\pi$  and 21-periodic functions.
- 15. Fourier series for odd and even functions.
- 16. Fourier series for functions defined on a segment [0; l] or on arbitrary segment [a;
- b]. Complex form of Fourier series.
- 17. Fourier integral. Fourier integral for odd and even functions.
- 18. Complex form of Fourier integral. Fourier transformation.

#### 2. Proofs and conclusions

1. Properties of number series.

2. The necessary condition for convergence.

3. Tests for convergence of positive terms series (comparison test, D'Alembert's test, Cauchy's test).

4. Alternating series. Leibniz test.

5. Absolute and conditional convergence

6. Domain of convergence for functional series.

7. Weierstrass' test for uniform convergence convergence.

8. Power series. Abel's theorem. Interval and radius of convergence of a power series.

9. Formulas of expansion of a function into Taylor's and Maclaurin's series.

10. Expansion of a function in a series.

11. Trigonometric Fourier series. Fourier coefficients. Dirichlet's theorem.

12. Formulas of expansion of a function into Fourier series for  $2\pi$ -periodic functions.

13. Formulas of expansion of a function into Fourier series for 21-periodic functions.

14. Formulas of expansion of a function into Fourier series for  $2\pi$ - and 21-periodic functions.

15. Formulas of expansion into Fourier series for odd and even functions.

16. Formulas of expansion into Fourier series for functions defined on a segment [0; l] or on arbitrary segment [a; b].

17. Formulas of expansion of a function into complex Fourier series.

18. Formulas of expansion of a function into Fourier integral.

19. Formulas of direct and inverse Fourier transformation.

#### 3. Assignments

1. Investigate number series applying sufficient condition for divergence and necessary condition for convergence.

2. Investigate positive terms series for convergence applying comparison test, D'Alembert's test, Cauchy's test.

3. Investigate alternating series for convergence applying Leibniz's test.

4. Investigate number series for absolute and conditional convergence.

5. Investigate functional series for uniform convergence applying Weierstrass' test.

6. Finding interval and radius of convergence of a power series. Taylor's and Maclaurin's series.

7. Finding expansion of a function into Taylor's and Maclaurin's series.

Applications of the series.

8. Finding expansion of a function into Fourier series.

9. Finding expansion of a function into Fourier integral.
