Compilers:
P.Nosko - Dr.ofTech.Sci, professor - general guidelines, tasks, part 1;
O.Bashta - PhD Engineering, associated professor - part 2, part 5, part 7;
A.Kornienko - PhD Engineering, associated professor - part 3, part 4, part 6.
The English language advisor:
G.Maksimovich, - senior lecturer (Foreign Languages for Specific Purposes Department, National Aviation University)
Reviewers:
A. Titov - PhD, senior researcher (National Technical University of Ukraine "Kyiv Polytechnic Institute named Igor Sikorsky", the department of Fluid Mechanics And Mechatronics);
O. Dukhota - PhD, assistant professor (National Aviation University, Educational and Research Aerospace Institute, the department of Aviation Machines Manufacturing and Repair Technologies)
Approved by the Scientific - Methodological - Editorial Board of the National Aviation University ( ).

Практикум включає завдання, рекомендації для виконання домашнього завдання з дисципліни "Механіка" та приклади розрахунків і проектування одноступінчатих редукторів.

Методичні рекомендації призначені для студентів спеціальності 173 "Авіоніка"
M45 Mechanics. Guide to Practical Classes / Authors: P.L.Nosko, O.V.Bashta, A.O.Kornienko - K.: NAU, 2020. - 48 p.

The Guide to Practical Classes includes tasks, recommendations for carrying out the homework assignments on the subject "Mechanics" and examples of analysis and design of single-stage speed reducers.

It is intended for students of speciality 173 "Avionics".

## GENERAL GUIDELINES

Mechanics is one of the most difficult disciplines for nonmechanical specialities, technical colleges and the first engineering discipline that combines theory and methodology of engineering designing.

Discipline "Mechanics" consists of two parts: "Strength of Materials" and "The calculation and design of mechanisms and their parts."

Study of the subject "Mechanics" as an applied discipline is combined with the work in the laboratory, where theoretically sound calculation formulas are checked according to the design and experimental data. When preparing and doing laboratory works the recommended literature should be used.

The discipline includes lectures, laboratory classes, consultations, homework assignment, two module tests on the sections of the lecture course and the exam.

Students must do homework assignments on their own and present them to the teacher for reviewing and then defend them before the first and second modular control work. Laboratory work must be performed under the guidance of a teacher in laboratory studies. After the defending homework, performing and protection a laboratory work and writing both modular examinations, students pass the exam.

While studying the subject "Mechanics" it is recommended to use these guidelines and other training manuals, guidelines and reference books.

## METHOD GUIDE TO CALCULATION AND GRAPHIC WORK

Calculation and graphic work is done by students in accordance with the curriculum and the program of the discipline "Mechanics".

To solve the problem, choose the number of the work and the variant that corresponds to the last two digits of the student's record book. The number of the work corresponds to the penultimate digit of the student's record book, and the number of a variant - the last digit. If the last number is zero, the student must perform the tenth variant. If the penultimate digit of a record book is zero, the student must fulfill the tenth number of the work. For example, a student whose record book
number is 830865 , should perform the fifth task of the sixth variant. Kinematic drives are shown in Fig. A, B, C, D, and the initial data are given in Table A.

Calculation and graphic work should contain explanatory notes and a graphic part.

The explanatory note is to be done in ink legibly on one (right) side of A4 paper, leaving 20 mm on the left margin for binding, 30 mm on the right for writing down the final results of calculations and notes of the reviewer. The distance from the first (last) line of the sheet to the top (or bottom) edge of the sheet must be not less than 10 mm . All pages must be numerated.

The first page of the explanatory note is the title page, the second - the kinematic scheme of the problem and initial data for them. Then goes the proper explanatory note. On the last page there is a list of references that must be referenced in the calculations.

The title page of the explanatory note, in block letters, should be printed as follows:

- university;
- department;
- discipline;
- number of homework assignment, task number and variant;
- surname, name of the student;
- course, faculty, record book number;
- date the assignment was done.

The calculation part of the work should be performed in accordance with the problem task. The text should have a clear category structure (sections, paragraphs and items with clear and concise headings). Contraction of the words in the text and captions are not allowed.

Formula, the empirical coefficients and other reference data should always be accompanied by references to the literature which must specify the numbers in square brackets according to the serial number in bibliography. When using the standards, make reference to them, for example choosing asynchronous motors by means of Table 1.2 or Annex B by standard 19523-81.

The used calculation formulas must have a name, and symbols with appropriate explanation.

To simplify for the author or reviser to check the work and to
avoid errors, it is recommended to do calculations in the following way: firstly you write the formula in symbols then without any algebraic changes substitute numerical values in the formula, and after that the result of the calculation. For example, at determining the pitch diameter of the gear, the calculation is written as: $\mathrm{d}_{2}=\mathrm{m} \mathrm{z}_{2}=20 * 3=60 \mathrm{~mm}$ where m is modulus, $\mathrm{z}_{2}$ - number of teeth on the wheel.

Stick to this rule otherwise it would be difficult to check and verify the calculation and, more over, it may result an error.

Missing data in the work should be selected on your own making reference to the relevant sources.

Calculations must be accompanied by illustrations (diagrams, sketches) done in pencil with exceptional clarity and completeness using a ruler and compass with indication of symbols and calculated values. Pictures may be placed either in the explanatory note or in the end of it, as an appendix. All illustrations in the explanatory notes should be numbered in Arabic numerals through the text (e.g. Fig. 1, Fig. 2) and accompanied by the notes exactly matching the content of the image.

Start drawing sketches as soon as all preliminary calculations provide sufficient data for the drawing. Drawings and calculations must be performed almost simultaneously, so that the calculations slightly precede the drawing, otherwise the errors which are inevitable can be revealed later and their correction will take time and effort. You must stick to the rule: all calculated data are checked immediately by marking them in the drawing.

The graphical part of each calculation task and graphic work should be done in pencil on drawing paper A2 in accordance with the standards for engineering drawings. In the right lower corner of the sheet the corner stamp of the title block in the drawing and diagrams (55x185) must be filled in.

Drawing of the gearing unit should be performed in two projections according to the scale and indication of sizes defined by calculations (see Annex A).

The sheets of drawings should be folded and filed at the end of the explanatory notes after references within one cover.

Fig A. Design a belt conveyor mechanical drive. If turning force Ft , peripheral speed V at well as diameter of sprockets D are given (Table A).

Fig B. Design a chain conveyor mechanical drive. If turning force Ft, peripheral speed V at well as diameter of sprockets D are given (Table A).

Fig. C. Design a chain conveyor mechanical drive. If turning force Ft , peripheral speed V at well as diameter of sprockets D are given (Table A ).

Fig D. Design a belt conveyor mechanical drive. If turning force Ft , peripheral speed V at well as diameter of sprockets $D_{d}$ are given (Table A).

| Numb er of task | Numb er of figure | Type of gearing |  | Variant number |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Engagement | Belt drive or Chain drive | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| 1 | A | Spur gears | Belt drive | $\frac{1.0}{2,0}$ | $\frac{1.5}{0,9}$ | $\frac{2.0}{0,7}$ | $\frac{2.5}{1,1}$ | $\frac{3.0}{0,8}$ | $\frac{3.5}{1,1}$ | $\frac{4.0}{0,5}$ | $\frac{4.5}{1,2}$ | $\frac{5.0}{1,0}$ | $\frac{5.5}{1,3}$ |
| 2 | B | Spur gears | Chain drive | $\frac{5.0}{1,0}$ | $\frac{4.0}{1,2}$ | $\frac{6.0}{1,5}$ | $\frac{4.0}{1,7}$ | $\frac{3.0}{1,9}$ | $\frac{5.0}{2,0}$ | $\frac{3.0}{2,1}$ | $\frac{2.0}{2,2}$ | $\frac{3.0}{2,3}$ | $\frac{2.8}{2,5}$ |
| 3 | C | Bevel gears | Chain drive | $\frac{1.8}{2,0}$ | $\frac{2.0}{2,5}$ | $\frac{2.4}{3,0}$ | $\frac{2.5}{4,0}$ | $\frac{2.0}{3,5}$ | $\frac{1.8}{3,8}$ | $\frac{2.0}{2,7}$ | $\frac{3.0}{3,2}$ | $\frac{2.2}{4,2}$ | $\frac{2.6}{2,8}$ |
| 4 | D | Bevel gears | Belt drive | $\frac{4.2}{1,5}$ | $\frac{2.0}{1,8}$ | $\frac{1.4}{2,0}$ | $\frac{2.0}{1,0}$ | $\frac{3.0}{1,7}$ | $\frac{4.5}{2,2}$ | $\frac{3.0}{2,4}$ | $\frac{2.4}{3,0}$ | $\frac{2.0}{2,7}$ | $\frac{1.0}{2,8}$ |
| 5 | A | Helical gear | Belt drive | $\frac{5.2}{1,3}$ | $\frac{4.3}{1,2}$ | $\frac{3.3}{0.6}$ | $\frac{4.8}{2,2}$ | $\frac{3.8}{0,7}$ | $\frac{2.6}{1,2}$ | $\underline{2.4}$ | $\frac{1.8}{1,9}$ | $\frac{1.4}{1,2}$ | $\frac{1.2}{1.6}$ |
| 6 | B | Helical gear | Chain drive | $\frac{2.7}{2,5}$ | $\frac{2.1}{2,5}$ | $\frac{3.2}{1,4}$ | $\frac{3.6}{1,3}$ | $\frac{5.2}{1,4}$ | $\frac{5.4}{2,0}$ | $\frac{4.2}{1,7}$ | $\frac{4.4}{1,2}$ | $\frac{1.7}{2,3}$ | $\frac{1.9}{2,5}$ |
| 7 | C | Bevel gears | Chain drive | $\frac{5.3}{1,2}$ | $\frac{4.2}{1,1}$ | $\frac{3.2}{0.8}$ | $\frac{4.7}{2,1}$ | $\frac{3.7}{0.8}$ | $\frac{2.7}{1,3}$ | $\frac{2.3}{1,5}$ | $\frac{1.7}{2,0}$ | $\frac{1.3}{1,4}$ | $\frac{1.6}{1,2}$ |
| 8 | D | Bevel gears | Belt drive | $\frac{2.1}{2,5}$ | $\frac{2.7}{2,6}$ | $\frac{3.4}{1,3}$ | $\frac{3.8}{1,4}$ | $\frac{5.4}{2,0}$ | $\frac{5.2}{1,4}$ | $\frac{4.4}{1,2}$ | $\frac{4.2}{1,7}$ | $\frac{1.9}{2,5}$ | $\frac{1.7}{2,3}$ |
| 9 | C | Bevel gears | Chain drive | $\frac{5.0}{1,0}$ | $\frac{4.4}{1,2}$ | $\frac{3.0}{0,9}$ | $\frac{4.6}{2,0}$ | $\frac{3.6}{2,0}$ | $\frac{2.6}{1,4}$ | $\frac{2.2}{1,6}$ | $\frac{1.6}{2,1}$ | $\frac{1.2}{1,6}$ | $\frac{1.7}{2,1}$ |
| 10 | A | Helical gear | Belt drive | $\frac{1.9}{2,0}$ | $\frac{2.1}{2,6}$ | $\frac{2.3}{3,0}$ | $\frac{2.6}{4,0}$ | $\frac{2.0}{2,5}$ | $\frac{1.7}{3,7}$ | $\frac{2.0}{3,5}$ | $\frac{3.2}{3,0}$ | $\frac{3.4}{2,8}$ | $\frac{2.9}{3,4}$ |

## The order of execution of the calculation and graphic works is as follows:

1. Choose the initial data for calculation and the kinematic scheme of the drive from Table 1.
2. Define the purpose, principle and condition of the drive according to kinematic scheme.
3. Make kinematic calculation of the drive to:

- determine the requirements for the motor power and the shaft rotation speed;
- find the standard motor using the catalogue;
- determine the overall gear ratio of the drive and distribute it between each transmission.

4. Calculate the strength of the gear and:

- select materials for gears;
- determine the allowable stress;
- calculate distance between gear centers;
- determine all necessary dimensions of gears.

5. Determine and calculated the set diameter of a shaft taking into account the condition of torsional strength.
6. Knowing the diameter of the shaft for gears installation, choose the key parameters from the standard and calculate key strength.
7. Write the explanatory note with the complete calculation of the drive.
8. Draw the gear unit with the main geometric dimensions of gears on drawing sheet A2 (examples of drawing see in Annex A).

## 1. KINEMATIC AND FORCE ANALYSIS OF A MECHANICAL DRIVE

## Initial data:

Turning force $\mathrm{F}_{\mathrm{t}}=11 \mathrm{kN}$; Conveyor belt speed $\mathrm{V}=0.87 \mathrm{~m} / \mathrm{sec}$;
Sprocket's diameter $\mathrm{D}_{\mathrm{e}}=400 \mathrm{~mm}$

Fig. 1.1. Design a belt conveyor mechanical drive. If turning force Ft , peripheral speed V at well as diameter of sprockets $D$ are given (Table A).

The mechanism consists of: asynchronous 4A series motor; belt drive with flat belt; helical spur gear speed reducer; rolling contact bearings; coupling with rubber bushed studs.
1.1. Determine the output power.

$$
\mathrm{P}_{\text {out }}=\mathrm{F}_{\mathrm{t}} \cdot \mathrm{~V}=11 \cdot 0.87=9.57 \mathrm{~kW}
$$

1.2. Determine the total drive efficiency.

In general, the efficiency of the drive is determined as a product of efficiencies of all kinematic pairs and links where the input power is lost.

$$
\eta=\eta_{1} \cdot \eta_{2} \cdot \ldots \cdot \eta_{\mathrm{n}}
$$

In this case

$$
\eta=\eta_{\text {hsg }} \cdot \eta_{\mathrm{cd}} \cdot \eta_{\mathrm{c}} \cdot \eta_{\mathrm{b}}^{3},
$$

where $\eta_{b d}$ is the efficiency of the belt drive;
$\eta_{\text {hsg }}$ is the efficiency of the helical spur gearing;
$\eta_{\mathrm{c}}$ is the efficiency of the coupling;
$\eta_{\mathrm{b}}$ takes into account losses in one pair of bearings.
The magnitudes of all efficiencies are given in table 1.1.
Let us assume that $\eta_{\mathrm{cd}}=0.96, \eta_{\text {hss }}=0.97, \eta_{\mathrm{c}}=0.996, \eta_{\mathrm{b}}=0.99$. Then

$$
\eta=0.96 \cdot 0.97 \cdot 0.996 \cdot 0.99^{3}=0.899
$$

Mind that the magnitude of the total efficiency must be rounded off to thousands.

Table 1.1
Efficiencies of gearings

| Name | Efficiency |  | Velocity ratio diapazone |
| :---: | :---: | :---: | :---: |
|  | Closed drive | Opened drive |  |
| Gearings: - straight spur gears | 0,98-0,99 | 0,94-0,96 | 3-6 |
| - helical spur gears | 0,97-0,98 | 0,94-0,95 |  |
| - bevel gears | 0,96-0,98 | 0,92-0,94 | 1-4 |
| Worm gearing: -one thread worm -two thread worm -four thread worm |  |  |  |
|  | 0,7-0,75 |  |  |
|  | 0,75-0,82 |  |  |
|  | 0,82-0,92 |  |  |
| Belt drives: |  |  |  |
| - flat belt drive |  | 0,96-0,98 | 2-5 |
| - V-belt drive |  | 0,95-0,97 |  |
| - toothed belt drive |  | 0,94-0,97 |  |
| Chain drives: $\square$ |  |  |  |
| - roller chain |  | 0,94-0,96 | 1.5-6 |
| - toothed chain |  | 0,96-0,97 |  |
| Couplings: |  |  |  |
| - with rubber bushed | 0,996 |  |  |
| studs | 0,985-0,995 |  |  |
| - flexible coupling | , |  |  |
| - rigid coupling |  |  |  |
| Bearings: | 0,99-0,995 |  |  |
| - rolling bearings | 0,98-0,985 |  |  |
| - sliding bearings |  |  |  |

1.3. Determine the input power.

Taking into account the fact that the efficiency is determined as ratio of the output power to the input one

$$
\eta=\frac{P_{\text {out }}}{P_{\text {inp }}}
$$

we can find the needed power of the electrical motor by the formula

$$
P_{\text {inp }}=\frac{P_{\text {out }}}{\eta}=\frac{9.57}{0.899}=10.65 \mathrm{~kW} .
$$

### 1.4. Select the electrical motor type.

For the given mechanical drives we use asynchronous electrical motor. It is explained by the fact that in comparison with the other types of motors, asynchronous electrical motors are simpler in design and maintenance, more reliable and less expensive.

Asynchronous motors are chosen according to table 1.2 the choice depends on the input power $\mathrm{P}_{\text {inp }}$ of a mechanical drive and the synchronous rotational speed $\mathrm{n}_{\mathrm{s}}$ (rotational speed of a magnetic field that characterizes motor operation without load).

Table 1.2
Asynchronous motors of 4A seryes

| Rated <br> Power <br> $P_{r}, \mathrm{~kW}$ | Synchronous rotational speed $n_{s}$, rpm |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Type <br> designation | $S, \%$ | Type <br> designation | $S, \%$ | Type <br> designation | $S, \%$ |
|  | 63 B 2 | 8,5 | 71 A 4 | 7,3 | 71 B 6 | 10 |
| 0,75 | 71 A 2 | 5,9 | 71 B 4 | 7,5 | 80 A 6 | 8,4 |
| 1,1 | 71 B 2 | 6,3 | 80 A 4 | 5,4 | 80 B 6 | 8,0 |
| 1,5 | 80 A 2 | 4,2 | 80 B 4 | 5,8 | 90 L 6 | 6,4 |
| 2,2 | 80 B 2 | 4,3 | 90 L 4 | 5,1 | 100 L 6 | 5,1 |
| 3,0 | 90 L 2 | 4,3 | 100 S 4 | 4,4 | 112 MA 6 | 4,7 |
| 4,0 | 100 S 2 | 3,3 | 100 L 4 | 4,7 | 112 MB 6 | 5,1 |
| 5,5 | 100 L 2 | 3,4 | 112 M 4 | 3,7 | 132 S 2 | 3,3 |
| 7,5 | 112 M 2 | 2,5 | 132 S 4 | 3,0 | 132 M 6 | 3,2 |
| 11,0 | 132 M 2 | 2,3 | 132 M 4 | 2,8 | 160 S 6 | 2,7 |
| 15 | 160 S 2 | 2,1 | 160 S 4 | 2,3 | 160 M 6 | 2,6 |
| 18,5 | 160 M 2 | 2,1 | 160 M 4 | 2,2 | 180 M 6 | 2,7 |
| 22 | 180 S 2 | 2,0 | 180 S 4 | 2,0 | 200 M 6 | 2,8 |
| 30 | 180 M 2 | 1,9 | 180 M 4 | 1,9 | 200 L 6 | 2,1 |

It is recommended to take asynchronous motors of either synchronous rotational speed $n_{s}=1500 \mathrm{rpm}$ or $\mathrm{n}_{\mathrm{s}}=1000 \mathrm{rpm}$ for the
given mechanical drives.
In our case we select 4A160S6 Induction Motor ( $\mathrm{P}_{\mathrm{r}}=11 \mathrm{~kW}, \mathrm{n}_{\mathrm{s}}$ $=1000 \mathrm{rpm}$ ).
1.5. Determine the motor rated rotational speed $n_{r}$.

$$
\mathrm{n}_{\mathrm{r}}=\mathrm{n}_{\mathrm{s}}\left(1-\frac{\mathrm{S}}{100}\right)
$$

where S is relative speed loss that is determined according to table 1.2 . In our case $\mathrm{S}=2.7 \%$. After substituting the corresponding magnitudes we obtain

$$
\mathrm{n}_{\mathrm{r}}=1000 \cdot\left(1-\frac{2.7}{100}\right)=973 \mathrm{rpm} .
$$

1.6. Determine the output rotational speed.

$$
\mathrm{n}_{\text {out }}=\frac{60 \cdot \mathrm{~V}}{\pi \cdot \mathrm{D}}=\frac{60 \cdot 0.87}{3.14 \cdot 0.4}=41.56 \mathrm{rpm} .
$$

1.7. Determine the total velocity ratio of the mechanical drive

$$
\mathrm{u}=\frac{\mathrm{n}_{\text {inp }}}{\mathrm{n}_{\text {out }}}=\frac{973}{41.56}=23.41
$$

1.8. Distribute the total velocity ratio between mechanical drive steps.

The total velocity ratio can be found by the formula

$$
\mathrm{u}=\mathrm{u}_{\mathrm{bd}} \cdot \mathrm{u}_{\mathrm{hsg}},
$$

where $u_{\text {bd. }}$ is the belt drive velocity ratio; $u_{\text {hsg }}$ is the helical spur gearing velocity ratio.

First, determine the velocity ratio of speed reducer.
It should correspond to the following standard series* and be in diapazone corresponding the table 1.1.

*     - for spur and bevel gear speed reducers:
$1.25 ; 1.4 ; 1.6 ; 1.8 ; 2.0 ; 2.24 ; 2.5 ; 2.8 ; 3.15 ; 3.55 ; 4.0 ; 4.5 ; 5.0 ; 5.6$
Let us take $u_{\text {hsg }}=5.6$.
Then the velocity ratio $\mathrm{u}_{\mathrm{bd}}=\frac{\mathrm{u}}{\mathrm{u}_{\text {hsg }}}=\frac{23.41}{5.6}=4.18$;
(for belt drives the obtained value of $u_{b d}$ should range from 2 to 4 ; for chain drives $u_{c d}=$ from 1.5 to 4 ).
1.9. Determine the rotational speed of all shafts.
$\mathrm{n}_{1}=\mathrm{n}_{\mathrm{r}}=973 \mathrm{rpm}$;
$\mathrm{n}_{2}=\frac{\mathrm{n}_{1}}{\mathrm{u}_{\mathrm{bd}}}=\frac{973}{4.18}=232.78 \mathrm{rpm} ;$
$\mathrm{n}_{3}=\frac{\mathrm{n}_{2}}{\mathrm{u}_{\text {hsg }}}=\frac{232.78}{5.6}=41.57 \mathrm{rpm} ;$
The obtained value of $n_{3}$ must be equal to $n_{\text {out }}$ according to the initial data. Error $\varepsilon$ must be not more than $4 \%$. In our case $\varepsilon=2.7 \%$.
1.10. Determine the angular velocity of all mechanical drive shafts:
$\omega_{1}=\frac{\pi \mathrm{n}_{1}}{30}=\frac{3.14 \cdot 973}{30}=104.71 \mathrm{sec}^{-1}$;
$\omega_{2}=\frac{\omega_{1}}{\mathrm{u}_{\mathrm{bd}}}=\frac{104.71}{4.18}=25.08 \mathrm{sec}^{-1}$;
$\omega_{3}=\frac{\omega_{2}}{\mathrm{u}_{\text {hsg }}}=\frac{25.08}{5.6}=4.47 \mathrm{sec}^{-1} ;$
1.11. Determine the power on mechanical drive shafts.

Calculation is carried out with respect to $\mathrm{P}_{\text {inp }}$, determined in point 1.3.
$\mathrm{P}_{1}=\mathrm{P}_{\text {inp }}=10.65 \mathrm{~kW}$;
$P_{2}=P_{1} \cdot \eta_{\text {bd }} \cdot \eta_{b}=10.65 \cdot 0.96 \cdot 0.99=10.12 \mathrm{~kW}$;
$\mathrm{P}_{3}=\mathrm{P}_{2} \cdot \eta_{\text {hsg }} \cdot \eta_{\mathrm{b}}^{2} \cdot=10.12 \cdot 0.97 \cdot 0.99^{2}=9.62 \mathrm{~kW}$;
The obtained magnitude of $\mathrm{P}_{3}$ must be equal to $\mathrm{P}_{\text {out }}$ according to the initial data. Error should not be more than $1 \%$. In our case $\varepsilon=0.5 \%$.
1.12. Determine the torques on all shafts.

$$
\begin{aligned}
& \mathrm{T}_{1}=\frac{\mathrm{P}_{1}}{\omega_{1}}=\frac{10.65 \cdot 10^{3}}{104.71}=101.71 \mathrm{~N} \cdot \mathrm{~m} \\
& \mathrm{~T}_{2}=\frac{\mathrm{P}_{2}}{\omega_{2}}=\frac{10.12 \cdot 10^{3}}{25.08}=403.99 \mathrm{~N} \cdot \mathrm{~m} \\
& \mathrm{~T}_{3}=\frac{\mathrm{P}_{3}}{\omega_{3}}=\frac{9.62 \cdot 10^{3}}{4.47}=2152.13 \mathrm{~N} \cdot \mathrm{~m}
\end{aligned}
$$

Checking: $\mathrm{T}_{\text {out }}=\mathrm{T}_{3}=\mathrm{F}_{\mathrm{t}} \frac{\mathrm{D}}{2}=\frac{11 \cdot 10^{3} \cdot 0.4}{2}=2200 \mathrm{~N} \cdot \mathrm{~m}$.

## 2. CALCULATION OF ALLOWABLE STRESSES

2.1. Select the material of toothed wheels.

The main material of toothed wheels is carbon and alloy steels. Depending on material hardness, toothed wheels are subdivided into two groups:

- toothed wheels with surface hardness $\mathrm{H} \leq 350 \mathrm{BHN}$ :
- toothed wheels with surface hardness H $>350$ BHN Brinell hardness number.
For general purpose speed reducers, the following alternatives are possible:
a) A pinion and a gear are made of identical carbon or alloy steel, such as $45(0.45 \mathrm{C})$, 40 X ( $0.40 \mathrm{C}-\mathrm{Cr}$ ), 40 XH ( $0.40 \mathrm{C}-\mathrm{Cr}-\mathrm{Ni}$ ). Heat treatment of both, the gear and the pinion is martempering. The pinion hardness is ranged from 269 to 302 BHN and the gear hardness is ranged from 235 to 262 BHN .
b) A pinion and a gear are made of identical alloy steel, such as 40X ( $0.40 \mathrm{C}-\mathrm{Cr}$ ), 40 XH ( $0.40 \mathrm{C}-\mathrm{Cr}-\mathrm{Ni}$ ), 35XM ( $0.35 \mathrm{C}-\mathrm{Cr}-\mathrm{Mo}$ ). Heat treatment of the gear is martempering to hardness ranged from 269 to 302 BHN. Heat treatment of the pinion is martempering and surface (induction) hardening to hardness ranged from 45 to 50 HRC .

Toothed wheels of the straight and helical spur gears are recommended to produce according to the alternative a). If we deal with bevel gearing, the alternative b) is more preferable.
2.2. Determine the mean values of the gear and the pinion hardness:

- for the pinion

$$
\begin{aligned}
& \mathrm{H}_{\mathrm{m}}^{\mathrm{p}}=\frac{\mathrm{H}_{\min }^{\mathrm{p}}+\mathrm{H}_{\max }^{\mathrm{p}}}{2} ; \\
& \mathrm{H}_{\mathrm{m}}^{\mathrm{g}}=\frac{\mathrm{H}_{\min }^{\mathrm{g}}+\mathrm{H}_{\max }^{\mathrm{g}}}{2} .
\end{aligned}
$$

2.3. Determine the allowable contact stress for the pinion and gear.

$$
\left[\sigma_{\mathrm{H}}^{\mathrm{p}}\right]=\frac{\sigma_{\mathrm{Hlim}}^{\mathrm{p}} \cdot \mathrm{~K}_{\mathrm{HL}}}{\mathrm{~S}_{\mathrm{H}}^{\mathrm{p}}}, \quad\left[\sigma_{\mathrm{H}}^{\mathrm{g}}\right]=\frac{\sigma_{\mathrm{Hlim}}^{\mathrm{g}} \cdot \mathrm{~K}_{\mathrm{HL}}}{\mathrm{~S}_{\mathrm{H}}^{\mathrm{g}}} .
$$

2.3.1. Determine the limit of contact endurance for the pinion $\sigma_{\mathrm{H} \lim }^{\mathrm{p}}$ and for the gear $\sigma_{\mathrm{H} \text { lim }}^{\mathrm{g}}$ according to table 2.1.

Table 2.1
Contact and bending endurance limits

| Heat treatment | Tooth hardness |  | Gear material | $\sigma_{H \text { lim }}, \mathrm{MPa}$ | $\sigma_{\text {blim }}, \mathrm{MPa}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | case | core and root |  |  |  |
| Normalizing, martempering | Brinell 18 | to 350 | Carbon and alloy steels, such as 45 $(0.45 \mathrm{C}), 40 \mathrm{X}(0.40 \mathrm{C}-$ $\mathrm{Cr}), 40 \mathrm{XH}(0.40 \mathrm{C}-$ $\mathrm{Cr}-\mathrm{Ni}), 50 \mathrm{XH}$ $(0.50 \mathrm{C}-\mathrm{Cr}-\mathrm{Ni})$, and $35 \mathrm{XM}(0.35 \mathrm{C}-\mathrm{Cr}-$ $\mathrm{Mo})$ | $2 H_{m}+70$ | $1.8 H_{m}$ |
| Full hardening | Rockwell C | 40 to 55 | Carbon and alloy steels, such as 45 $(0.45 \mathrm{C}), 40 \mathrm{X}(0.40 \mathrm{C}-$ $\mathrm{Cr}), 40 \mathrm{XH}(0.40 \mathrm{C}-$ $\mathrm{Cr}-\mathrm{Ni})$, and 35 XM $(0.35 \mathrm{C}-\mathrm{Cr}-\mathrm{Mo})$ | $18 H_{m}+150$ | 500 |
| Surface hardening | $\begin{gathered} \text { Rockwell C, } \\ 40 \text { to } 58 \end{gathered}$ | $\begin{array}{\|c} \text { Rockwell C, } \\ 25 \text { to } 35 \end{array}$ | Alloy steels, such as 40X ( $0.40 \mathrm{C}-\mathrm{Cr}$ ), 40XH ( $0.40 \mathrm{C}-\mathrm{Cr}-\mathrm{Ni}$ ), 50 XH ( $0.50 \mathrm{C}-\mathrm{Cr}-\mathrm{Ni}$ ), and 35XM (0.35C-Cr-Mo) | $17 H_{m}+200$ | 650 |
| Case hardening | $\begin{aligned} & \text { Rockwell C, } \\ & 54 \text { to } 64 \end{aligned}$ | $\begin{gathered} \text { Rockwell C, } \\ 30 \text { to } 45 \end{gathered}$ | Alloy steels, such as 20XH2M (0.20C-Cr$2 \mathrm{Ni}-\mathrm{Mo}$ ) | $23 \mathrm{H}_{\text {m }}$ | 950 |
| Nitriding | $\begin{gathered} \text { Rockwell C, } \\ 50 \text { to } 60 \end{gathered}$ | Rockwell C, $24 \text { to } 40$ | Alloy steels, such as 40XH2MA (0.40C-$\mathrm{Cr}-2 \mathrm{Ni}-\mathrm{Mo}$, quality) | 1050 | $\begin{gathered} 300+1.2 H_{m} \\ \text { (of tooth } \\ \text { core) } \end{gathered}$ |

$$
\begin{gathered}
\sigma_{\text {Hlim }}^{\mathrm{p}}=17 \cdot \mathrm{H}_{\mathrm{m}}^{\mathrm{p}}+200=17 \cdot 47.5+200=1007.5 \mathrm{MPa} \\
\sigma_{\text {Him }}^{\mathrm{g}}=2 \cdot \mathrm{H}_{\mathrm{m}}^{\mathrm{g}}+70=2 \cdot 285.5+70=641 \mathrm{MPa}
\end{gathered}
$$

2.3.2. Determine the base number of stress cycles for the pinion $\mathrm{N}_{\mathrm{H} 0}^{\mathrm{p}}$ and the gear $\mathrm{N}_{\mathrm{H} 0}^{\mathrm{g}}$. For this purpose we use table 2.2.

Table 2.2
Base number of stress cycles

| $\mathrm{BHN}_{\mathrm{m}}$ | up to 200 | 250 | 300 | 350 | 400 | 450 | 500 | 550 | 600 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{HRC}_{\mathrm{m}}$ | - | 25 | 32 | 38 | 43 | 47 | 52 | 56 | 60 |
| $\mathrm{~N}_{\mathrm{H} 0} \cdot 10^{6}$ | 10 | 16.5 | 25 | 36.4 | 50 | 68 | 87 | 114 | 143 |

$\mathrm{N}_{\mathrm{H} 0}^{\mathrm{p}}=68.9 \cdot 10^{6}$ stress cycles;
$\mathrm{N}_{\mathrm{H} 0}^{\mathrm{g}}=22.5 \cdot 10^{6}$ stress cycles.
2.3.3. The gearing service life in hours is:

$$
\mathrm{t}=4000 \ldots 5000 \text { hours }
$$

2.3.4. Let factor $\mathrm{K}_{\mathrm{HE}}$ that reduces variable load conditions to the constant load equivalence be:

$$
\mathrm{K}_{\mathrm{HE}}=1
$$

2.3.5. Determine the equivalent number of cycles for the pinion and the gear.

$$
\begin{aligned}
& \mathrm{N}_{\mathrm{HE}}^{\mathrm{p}}=60 \cdot \mathrm{n}^{\mathrm{p}} \cdot \mathrm{t} \cdot \mathrm{~K}_{\mathrm{HE}} ; \\
& \mathrm{N}_{\mathrm{HE}}^{\mathrm{g}}=60 \cdot \mathrm{n}^{\mathrm{g}} \cdot \mathrm{t} \cdot \mathrm{~K}_{\mathrm{HE}}
\end{aligned}
$$

where $n^{p}$ and $n^{g}$ are rotational speeds of the pinion and the gear correspondingly.
2.3.6. Determine the durability factor for the pinion and the gear if:

$$
\begin{gathered}
\mathrm{N}_{\mathrm{HE}} \geq \mathrm{N}_{\mathrm{HO}} \text { then } \mathrm{K}_{\mathrm{HL}}=1, \\
\mathrm{~N}_{\mathrm{HE}}<\mathrm{N}_{\mathrm{HO}} \text { then } \mathrm{K}_{\mathrm{HL}}=\sqrt[6]{\frac{\mathrm{N}_{\mathrm{H} 0}}{\mathrm{~N}_{\mathrm{HE}}}} . \\
\mathrm{N}_{\mathrm{HE}}^{\mathrm{p}}=60 \cdot 239.23 \cdot 5000 \cdot 1=71.769 \cdot 10^{6} ; \mathrm{N}_{\mathrm{H} 0}^{\mathrm{p}}=68.9 \cdot 10^{6}, \mathrm{~N}_{\mathrm{HE}}^{\mathrm{p}}>\mathrm{N}_{\mathrm{H} 0}^{\mathrm{p}}, \\
\text { then } \mathrm{K}_{\mathrm{HL}}^{\mathrm{p}}=1 ; \\
\mathrm{N}_{\mathrm{HE}}^{\mathrm{g}}=60 \cdot 42.72 \cdot 1 \cdot 5000 \cdot 1=12.816 \cdot 10^{6} ; \mathrm{N}_{\mathrm{H} 0}^{\mathrm{g}}=22.5 \cdot 10^{6}, \mathrm{~N}_{\mathrm{HE}}^{\mathrm{g}}>\mathrm{N}_{\mathrm{H} 0}^{\mathrm{g}}, \\
\text { then } \mathrm{K}_{\mathrm{HL}}^{\mathrm{g}}=1 .
\end{gathered}
$$

2.3.7. Determine the safety factor $\mathrm{S}_{\mathrm{H}}$ for the pinion and the gear.

- for homogeneous structure of the material (heat treatment is normalizing, martempering and full hardening) $\mathrm{S}_{\mathrm{H}}=1.1$;
- for heterogeneous structure of the material (heat treatment is
surface hardening, case hardening, nitriding) $\mathrm{S}_{\mathrm{H}}=1.2$.
2.3.8. Determine the contact allowable stresses for the gear and for the pinion

$$
\left[\sigma_{\mathrm{H}}^{\mathrm{p}}\right]=\frac{\sigma_{\mathrm{Hlim}}^{\mathrm{p}} \cdot \mathrm{~K}_{\mathrm{HL}}}{\mathrm{~S}_{\mathrm{H}}^{\mathrm{p}}}, \quad\left[\sigma_{\mathrm{H}}^{\mathrm{g}}\right]=\frac{\sigma_{\mathrm{Hlim}}^{\mathrm{g}} \cdot \mathrm{~K}_{\mathrm{HL}}}{\mathrm{~S}_{\mathrm{H}}^{\mathrm{g}}} .
$$

In our case: $\quad S_{H}^{p}=1.2 ; S_{H}^{g}=1.1$;

$$
\left[\sigma_{\mathrm{H}}^{\mathrm{p}}\right]=\frac{1007.5 \cdot 1}{1.2}=839.58 \mathrm{MPa} ; \quad\left[\sigma_{H}^{g}\right]=\frac{641 \cdot 1}{1.1}=582.73 \mathrm{MPa} .
$$

If $\mathrm{H}^{\mathrm{p}}-\mathrm{H}^{\mathrm{g}} \leq 70 \mathrm{BHN}$, we assume that the design allowable contact stress is less value of above calculated stresses, where $\mathrm{H}^{\mathrm{p}}$ and $\mathrm{H}^{\mathrm{g}}$ are hardness of the pinion and gear materials correspondingly.

Otherwise, the design allowable contact stress is determined by the following formula:

$$
\left[\sigma_{\mathrm{H}}\right]=0.45 \cdot\left(\left[\sigma_{\mathrm{H}}^{\mathrm{p}}\right]+\left[\sigma_{\mathrm{H}}^{\mathrm{g}}\right]\right) \leq 1.23 \cdot\left[\sigma_{\mathrm{H}}^{\mathrm{g}}\right] .
$$

Thus, for further calculations we assume as the design allowable contact stress $\left[\sigma_{H}\right]=640.04 \mathrm{MPa}$.
2.4. Determine the allowable bending stresses for the pinion and for the gear.

$$
\left[\sigma_{\mathrm{b}}^{\mathrm{p}}\right]=\frac{\sigma_{\mathrm{blim}}^{\mathrm{p}} \cdot \mathrm{~K}_{\mathrm{bL}}}{\mathrm{~S}_{\mathrm{b}}^{\mathrm{p}}}, \quad\left[\sigma_{\mathrm{b}}^{\mathrm{g}}\right]=\frac{\sigma_{\mathrm{blim}}^{\mathrm{g}} \cdot \mathrm{~K}_{\mathrm{bL}}}{\mathrm{~S}_{\mathrm{b}}^{\mathrm{g}}}
$$

2.4.1. Determine the limits of the bending endurance for the pinion $\sigma_{\mathrm{b} \text { lim }}^{\mathrm{p}}$ and for the gear $\sigma_{\mathrm{b} \text { lim }}^{\mathrm{g}}$. For this purpose we use table 2.1.
In our case

$$
\begin{gathered}
\sigma_{b l i m}^{\mathrm{p}}=650 \mathrm{MPa} \\
\sigma_{\mathrm{blim}}^{\mathrm{g}}=1.8 \cdot \mathrm{H}_{\mathrm{m}}^{\mathrm{g}}=1.8 \cdot 285.5=513.9 \mathrm{MPa}
\end{gathered}
$$

2.4.2. Determine the base number of stress cycles $\mathrm{N}_{\mathrm{b} 0}$. For steels $\mathrm{N}_{\mathrm{b} 0}=4 \cdot 10^{6}$.
2.4.3. Let factor $K_{b E}$ that reduces variable load conditions to the
constant load equivalence be

$$
\mathrm{K}_{\mathrm{bE}}=1
$$

2.4.4. Determine the equivalent number of cycles for the pinion and the gear.

$$
\begin{aligned}
& \mathrm{N}_{\mathrm{bE}}^{\mathrm{p}}=60 \cdot \mathrm{n}^{\mathrm{p}} \cdot t \cdot \mathrm{~K}_{\mathrm{bE}} ; \\
& \mathrm{N}_{\mathrm{bE}}^{\mathrm{g}}=60 \cdot \mathrm{n}^{\mathrm{g}} \cdot t \cdot \mathrm{~K}_{\mathrm{bE}} ; \\
& \mathrm{N}_{\mathrm{bE}}^{\mathrm{p}}=60 \cdot 239.23 \cdot 5000 \cdot 1=71.769 \cdot 10^{6} ; \\
& \mathrm{N}_{\mathrm{bE}}^{\mathrm{g}}=60 \cdot 42.72 \cdot 5000 \cdot 1=12.816 \cdot 10^{6} .
\end{aligned}
$$

2.4.5. Determine the durability factor for the pinion and the gear if:

$$
\begin{gathered}
\mathrm{N}_{\mathrm{bE}} \geq \mathrm{N}_{\mathrm{b} 0} \text { then } \mathrm{K}_{\mathrm{bL}}=1, \\
\mathrm{~N}_{\mathrm{bE}}<\mathrm{N}_{\mathrm{b} 0} \text { then } \mathrm{K}_{\mathrm{bL}}=\sqrt[m]{\frac{\mathrm{N}_{\mathrm{b} 0}}{\mathrm{~N}_{\mathrm{bE}}}},
\end{gathered}
$$

where $\mathrm{m}=3$ for toothed wheels with hardness $\mathrm{H} \leq 350 \mathrm{BHN}$ and $\mathrm{m}=9$ if $\mathrm{H}>350 \mathrm{BHN}$.

In our case: $\mathrm{N}_{\mathrm{bE}}^{\mathrm{p}}>\mathrm{N}_{\mathrm{b} 0}^{\mathrm{p}}$, then $\mathrm{K}_{\mathrm{bL}}^{\mathrm{p}}=1$;
$\mathrm{N}_{\mathrm{bE}}^{\mathrm{g}}>\mathrm{N}_{\mathrm{b} 0}^{\mathrm{g}}$, then $\mathrm{K}_{\mathrm{bL}}^{\mathrm{g}}=1$.
2.4.6. Determine safety factor $\mathrm{S}_{\mathrm{b}}$ for the pinion and for the gear.

- for wheels made of forged blanks (our case) $\quad \mathrm{S}_{\mathrm{b}}=1.75$;
- for wheels made of cast blanks $\quad \mathrm{S}_{\mathrm{b}}=2.3$.
2.4.7. Determine the bending allowable stresses for the gear and the pinion

$$
\left[\sigma_{\mathrm{b}}^{\mathrm{p}}\right]=\frac{\sigma_{\mathrm{blim}}^{\mathrm{p}} \cdot \mathrm{~K}_{\mathrm{bL}}}{\mathrm{~S}_{\mathrm{b}}^{\mathrm{p}}}, \quad\left[\sigma_{\mathrm{b}}^{\mathrm{g}}\right]=\frac{\sigma_{\mathrm{blim}}^{\mathrm{g}} \cdot \mathrm{~K}_{\mathrm{bL}}}{\mathrm{~S}_{\mathrm{b}}^{\mathrm{g}}} .
$$

In our case: $\mathrm{S}_{\mathrm{b}}^{\mathrm{p}}=\mathrm{S}_{\mathrm{b}}^{\mathrm{g}}=1.75$;

$$
\left[\sigma_{\mathrm{b}}^{\mathrm{p}}\right]=\frac{650 \cdot 1}{1.75}=371.43 \mathrm{MPa} ; \quad\left[\sigma_{\mathrm{b}}^{\mathrm{g}}\right]=\frac{513.9 \cdot 1}{1.75}=293.657 \mathrm{MPa}
$$

For further calculations we assume that the design allowable bending stress has less value of above calculated stresses $\left[\sigma_{b}\right]=293.657 \mathrm{MPa}$.

## 3. STRENGTH CALCULATION OF THE STRAIGHT SPUR GEARS

Initial data*: torque on the pinion shaft $\mathrm{T}^{\mathrm{p}}=74 \mathrm{~N} \cdot \mathrm{~m}$; torque on the gear shaft $\mathrm{T}^{\mathrm{g}}=370 \mathrm{~N} \cdot \mathrm{~m}$; velocity ratio of the gearing $\mathrm{u}=5$; allowable contact stress $\left[\sigma_{H}\right]=515 \mathrm{MPa}$; allowable bending stress $\left[\sigma_{\mathrm{b}}\right]=255 \mathrm{MPa}$; hardness of the gear material $\mathrm{H}^{\mathrm{g}}=285 \mathrm{BHN}$, angular velocity of the gear shaft $\omega^{\mathrm{g}}=40 \mathrm{rad} / \mathrm{sec}$.
(" the initial data in the example are taken randomly, you should take them from the previous calculation)
3.1. Determine the centre distance of the straight spur gears

$$
a_{w}=0.85 \cdot(u+1) \cdot \sqrt[3]{\frac{T^{g} \cdot K_{H \beta} \cdot E_{t r}}{\left[\sigma_{H}\right]^{2} \cdot u^{2} \cdot \psi_{b a}}},
$$

where the sign (" + ") is used for gears with external toothing as in our case; $\mathbf{u}$ is the velocity ratio of the spur gears; $\mathbf{T}^{\mathbf{g}}$ is the torque at the gear shaft in $\mathrm{N} \cdot \mathrm{mm} ;\left[\boldsymbol{\sigma}_{\mathbf{H}}\right]$ is the allowable contact stress in MPa; $\mathbf{E}_{\mathbf{t r}}$ is the transformed modulus of elasticity in $\mathrm{MPa} ; \mathbf{K}_{\mathbf{H} \beta}$ is the load concentration factor; $\boldsymbol{\psi}_{\mathrm{ba}}=\mathrm{b}^{\mathrm{g}} / a_{\mathrm{w}}$ is the gear face width factor.

The transformed modulus of elasticity $\mathrm{E}_{\mathrm{tr}}$ is determined as

$$
E_{t r}=\frac{2 \cdot E^{p} \cdot E^{g}}{E^{p}+E^{g}},
$$

where $E^{p}$ and $E^{g}$ are the moduli of elasticity of pinion and gear materials respectively. Since the pinion and the gear are made of steel we can make the conclusion that $\mathrm{E}_{\mathrm{tr}}=\mathrm{E}^{\mathrm{p}}=\mathrm{E}^{\mathrm{g}}=2.1 \cdot 10^{5} \mathrm{MPa}$.

The load concentration factor $\mathrm{K}_{\mathrm{H}}$ is determined by means of table 3.1 depending on the disposition of the toothed wheels with respect to the bearings and the factor $\psi_{b d}=b^{g} / d^{p}$. Since $b^{g}$ and $d^{p}$ are not determined we find this factor by the following formula

$$
\psi_{\mathrm{bd}}=\frac{\mathrm{b}^{\mathrm{g}}}{\mathrm{~d}^{\mathrm{p}}}=\frac{0.5 \cdot \mathrm{~b}^{\mathrm{g}}}{a_{\mathrm{w}}} \cdot(\mathrm{u}+1)=0.5 \cdot \psi_{\mathrm{ba}} \cdot(\mathrm{u}+1),
$$

where the gear face width factor $\psi_{\text {ba }}$ is taken from table 3.2 depending on the position of the gear relative to the bearings, remembering that the value of $\psi_{\text {ba }}$ should correspond to the standard. The greater $\psi_{\text {ba }}$ the less overall dimensions of the gearing. That is why we select the greater value of $\psi_{\text {ba }}$.

In our case the gear is located symmetrically relative to support. That is why we take $\psi_{\mathrm{ba}}=0.5, \psi_{\mathrm{bd}}=0.5 \cdot 0.4 \cdot(5+1)=1.2, \mathrm{~K}_{\mathrm{H} \beta}=1.05$.

$$
\mathrm{a}_{\mathrm{w}}=0.85 \cdot(5+1) \cdot \sqrt[3]{\frac{511.62 \cdot 10^{3} \cdot 1.19 \cdot 2.1 \cdot 10^{5}}{640^{2} \cdot 5^{2} \cdot 0.4}}=163 \mathrm{~mm}
$$

The obtained magnitude of $\mathrm{a}_{\mathrm{w}}$ is rounded up according to the series given in table 3.3. We assume $a_{w}=180 \mathrm{~mm}$.

Table 3.1
Approximate values of $\mathbf{K}_{\mathrm{H}}$

| Gear arrangement <br> with respect to <br> bearings | Tooth <br> surface <br> hardness, <br> BHN | $\Psi_{\text {bd }}=\frac{\mathrm{b}^{\mathrm{g}}}{\mathrm{d}^{\mathrm{p}}}$ |  |  |  |  |  |  |

|  | Rockwell C, 40 upwards | 0.2 |

Table 3.3
Standard values of the centre distance $a_{w}$

| Series 1 | 63 | 80 | 100 | 125 | 160 | 200 | 250 | 315 | 400 | 500 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Series 2 | 71 | 90 | 112 | 140 | 180 | 224 | 280 | 355 | 450 | 560 |

3.2. Determine the nominal pitch circle diameter of the gear

$$
\mathrm{d}^{\mathrm{g}}=\frac{2 \cdot a_{\mathrm{w}} \cdot \mathrm{u}}{\mathrm{u}+1}=\frac{2 \cdot 180 \cdot 5}{5+1}=300 \mathrm{~mm} .
$$

3.3. Determine the face width of the gear

$$
\mathrm{b}^{\mathrm{g}}=\psi_{\text {ba }} \cdot a_{\mathrm{w}}=0.4 \cdot 180=72 \mathrm{~mm}
$$

3.4. Determine the module according to the strength condition for
bending

$$
\mathrm{m} \geq \frac{2 \cdot \mathrm{~K}_{\mathrm{m}} \cdot \mathrm{~T}^{\mathrm{g}}}{\mathrm{~d}^{\mathrm{g}} \cdot \mathrm{~b}^{\mathrm{g}} \cdot\left[\sigma_{\mathrm{b}}\right]}=\frac{2 \cdot 6.8 \cdot 370 \cdot 10^{3}}{300 \cdot 72 \cdot 255}=0.91 \mathrm{~mm},
$$

where $\mathrm{K}_{\mathrm{m}}$ is taken as 6.8 for straight spur gears.
The obtained value of the module should be rounded up according to the standard series given in table 3.4. It is necessary to note that for general-purpose speed reducers the minimum value of the module is $\mathrm{m}_{\text {min }}=2 \mathrm{~mm}$.

For our further calculations we assume $\mathrm{m}=2 \mathrm{~mm}$.
Table 3.4
Standard values of $\mathbf{m}_{\mathbf{n}}$

| Series 1 | 1.0 | 1.25 | 1.5 | 2.0 | 2.5 | 3.0 | 4.0 | 5.0 | 6.0 | 8.0 | 10.0 | 12.0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Series 2 | 1.125 | 1.375 | 1.75 | 2.25 | 2.75 | 3.5 | 4.5 | 5.5 | 7.0 | 9.0 | 11.0 | 14.0 |

Note: Series 1 is preferable to Series 2
3.5. Determine the total number of teeth

$$
\mathrm{z}_{\Sigma}=\frac{2 \cdot \mathrm{a}_{\mathrm{w}}}{\mathrm{~m}}=\frac{2 \cdot 180}{2}=180 .
$$

Obtained value of $z_{\Sigma}$ we should be rounded off to the nearest integer number.
3.6. Determine the number of pinion teeth

In our case $z^{p}=\frac{z_{\Sigma}}{u+1} \geq z_{\text {min }}$,
where $\mathrm{Z}_{\min }=17$ for straight spur gears.
The obtained value of $z^{p}$ should be rounded off to the nearest integer number. If $z^{p}<17$ it is necessary to decrease the module or to use nonstandard toothed wheels

$$
z^{p}=\frac{z \Sigma}{u+1}=\frac{180}{6}=30 \geq z_{\min }=17 .
$$

3.7. Determine the number of teeth of the gear

$$
z^{g}=z_{\Sigma}-z^{p}=180-30=150 .
$$

3.8. Specify the velocity ratio of the gearing

$$
\mathrm{u}_{\mathrm{act}}=\frac{\mathrm{z}^{\mathrm{g}}}{\mathrm{z}^{\mathrm{p}}}=\frac{150}{30}=5 .
$$

The error $\varepsilon=\left|\frac{\mathrm{u}_{\text {act }}-\mathrm{u}}{\mathrm{u}}\right| \cdot 100 \%$ should be less then or equal to $4 \%$. Otherwise the number of teeth $\mathrm{z}^{\mathrm{p}}, \mathrm{z}^{\mathrm{g}}$ and $\mathrm{z}_{\Sigma}$ must be rounded down.
3.9. Determine the nominal pitch circles diameters for the pinion and the gear

$$
\begin{gathered}
\mathrm{d}^{\mathrm{p}}=\mathrm{m} \cdot \mathrm{z}^{\mathrm{p}}=2 \cdot 30=60 \mathrm{~mm}, \\
\mathrm{~d}^{\mathrm{g}}=2 \cdot a_{\mathrm{w}}-\mathrm{d}^{\mathrm{p}}=2 \cdot 180-60=300 \mathrm{~mm} .
\end{gathered}
$$

3.10. Determine the addendum circles diameters for the pinion and the gear

$$
\begin{gathered}
\mathrm{d}_{\mathrm{a}}^{\mathrm{p}}=\mathrm{d}^{\mathrm{p}}+2 \cdot \mathrm{~m}=60+2 \cdot 2=64 \mathrm{~mm} \\
\mathrm{~d}_{\mathrm{a}}^{\mathrm{g}}=\mathrm{d}^{\mathrm{g}}+2 \cdot \mathrm{~m}=300+2 \cdot 2=304 \mathrm{~mm}
\end{gathered}
$$

3.11. Determine the dedendum circles diameters for the pinion and the gear

$$
\begin{gathered}
d_{f}^{p}=d^{p}-2.5 \cdot \mathrm{~m}=60-2.5 \cdot 2=55 \mathrm{~mm} \\
d_{f}^{\mathrm{g}}=\mathrm{d}^{\mathrm{g}}-2.5 \cdot \mathrm{~m}=300-2.5 \cdot 2=295 \mathrm{~mm} .
\end{gathered}
$$

3.12. Determine forces that act in the engagement of the straight spur gears:

- turning force $\mathrm{F}_{\mathrm{t}}=\frac{2 \cdot \mathrm{~T}^{\mathrm{g}}}{\mathrm{d}^{\mathrm{g}}}=\frac{2 \cdot 370}{0.3}=2467 \mathrm{~N} ;$
- radial force $\mathrm{F}_{\mathrm{r}}=\mathrm{F}_{\mathrm{t}} \cdot \operatorname{tg} \alpha_{\mathrm{w}}=2467 \cdot \operatorname{tg} 20^{\circ}=898 \mathrm{~N}$, where $\alpha_{w}=20^{\circ}$ is the pressure angle for the pitch circle.
3.13. Determine the maximum contact stress that develops in the contact zone of teeth

$$
\begin{aligned}
& \sigma_{\mathrm{H}}=1.18 \cdot \sqrt{\frac{\mathrm{~T}^{\mathrm{p}} \cdot \mathrm{~K}_{\mathrm{H}} \cdot \mathrm{E}_{\mathrm{tr}}}{\left(\mathrm{~d}^{\mathrm{p}}\right)^{2} \cdot \mathrm{~b}^{\mathrm{g}} \cdot \sin 2 \alpha_{\mathrm{w}}} \cdot\left(\frac{\mathrm{u}_{\mathrm{act}}+1}{\mathrm{u}_{\text {act }}}\right)}= \\
& =1.18 \cdot \sqrt{\frac{74 \cdot 10^{3} \cdot 1.19 \cdot 1.24 \cdot 2.1 \cdot 10^{5}}{60^{2} \cdot 72 \cdot \sin 40^{\circ}} \cdot\left(\frac{5+1}{5}\right)}=465 \mathrm{MPa}
\end{aligned}
$$

where $\mathrm{T}^{\mathrm{p}}$ is the torque on the pinion shaft in $\mathrm{N} \cdot \mathrm{mm} ; \mathrm{K}_{\mathrm{H}}$ is the design load factor whch is determined as $\mathrm{K}_{\mathrm{H}}=\mathrm{K}_{\mathrm{H} \beta} \cdot \mathrm{K}_{\mathrm{HV}}$ where $\mathrm{K}_{\mathrm{H} \beta}$ is the load concentration factor; $\mathrm{K}_{\mathrm{HV}}$ is the dynamic load factor.

The load concentration factor $\mathrm{K}_{\mathrm{H} \beta}$ is specified in table 3.2. It
depends upon $\psi_{\mathrm{bd}}=\frac{\mathrm{b}^{\mathrm{g}}}{\mathrm{d}^{\mathrm{p}}}=\frac{72}{60}=1.2$.
In order to determine $\mathrm{K}_{\mathrm{HV}}$ it is necessary to find the peripheral gear speed $\mathrm{V}^{\mathrm{g}}$

$$
\mathrm{V}^{\mathrm{g}}=\frac{\omega^{\mathrm{g}} \cdot \mathrm{~d}^{\mathrm{g}}}{2}=\frac{40 \cdot 0.3}{2}=6 \mathrm{~m} / \mathrm{sec}
$$

and the gearing accuracy of manufacturing (table 3.5), where $\boldsymbol{\omega}^{\mathbf{g}}$ is the angular velocity of the gear.

Table 3.5
Gearing accuracy of manufacturing

| Types of gear drives | Peripheral speed V, m/sec |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | under 5 | $5-8$ | $8-12.5$ | over 12.5 |
| Straight spur gear | 9 | 8 | 7 | 6 |
| Helical spur gear | 9 | 9 | 8 | 7 |
| Straight bevel gear | 8 | 7 | - | - |
| Spiral bevel gear | 9 | 9 | 8 | 7 |

The dynamic load factor $\mathrm{K}_{\mathrm{HV}}$ is determined according to table 3.6.
Table 3.6
Dynamic load factor $\mathbf{K}_{\mathbf{H V}}$

| Gear drive accuracy | Tooth surface hardness, BHN | Peripheral speed V, m/sec |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Note: The figures in the numerators refer to straight spur gears and those in the denominators - to helical spur gears.

The obtained value of $\sigma_{H}$ should correspond to the following condition:

$$
\sigma_{H}=(0.8 \ldots 1.1) \cdot\left[\sigma_{H}\right] .
$$

Otherwise it is necessary to change the center distance $\mathrm{a}_{\mathrm{w}}$ and make calculations once more.
3.14. Determine the maximum bending stress

$$
\sigma_{\mathrm{b}}=\frac{\mathrm{F}_{\mathrm{t}} \cdot \mathrm{~K}_{\mathrm{b} \beta} \cdot \mathrm{~K}_{\mathrm{bv}} \cdot \mathrm{Y}_{\mathrm{b}}}{\mathrm{~m} \cdot \mathrm{~b}^{\mathrm{g}}}=\frac{2467 \cdot 1.42 \cdot 1.58 \cdot 3.6}{2 \cdot 72}=138.4 \mathrm{MPa} \leq\left[\sigma_{\mathrm{b}}\right]=255 \mathrm{MPa},
$$

where $K_{b \beta}$ is the load concentration factor that is determined according to table 3.7 ; $\mathrm{K}_{\mathrm{bv}}$ is the dynamic load factor determined according to table 3.8; $\mathrm{Y}_{\mathrm{b}}$ is the tooth shape factor that is determined by means of table 3.9 depending upon the number of gear teeth when the offset factor $\mathrm{x}=0$.

If the obtained value of $\sigma_{b}>\left[\sigma_{b}\right]$ it is necessary to increase the module.

## 4. STRENGTH CALCULATION OF THE HELICAL SPUR GEARS

4.1. Determine the center distance of the helical spur gears

$$
\mathrm{a}_{\mathrm{w}}=0.75 \cdot(\mathrm{u}+1) \cdot \sqrt[3]{\frac{\mathrm{T}^{\mathrm{g}} \cdot \mathrm{~K}_{\mathrm{H}} \cdot \mathrm{E}_{\mathrm{tr}}}{\left[\sigma_{\mathrm{H}}\right]^{2} \cdot \mathrm{u}^{2} \cdot \psi_{\mathrm{ba}}}},
$$

where $\mathbf{u}$ is the velocity ratio of the gearing; $\mathbf{T}^{\mathbf{g}}$ is the torque at the gear shaft in $\mathrm{N} \cdot \mathrm{mm} ;\left[\boldsymbol{\sigma}_{\mathbf{H}}\right]$ is the allowable contact stress in MPa; $\mathbf{E}_{\mathbf{t r}}$ is the transformed modulus of elasticity in $\mathrm{MPa} ; \mathbf{K}_{\mathbf{H} \beta}$ is the load concentration factor; $\psi_{b a}=b^{\mathrm{g}} / \mathrm{a}_{\mathrm{w}}$ is the gear face width factor.

Transformed modulus of elasticity $\mathrm{E}_{\mathrm{tr}}$ is determined as

$$
E_{t r}=\frac{2 \cdot E^{p} \cdot E^{g}}{E^{p}+E^{g}},
$$

where $E^{p}$ and $E^{g}$ are the moduli of elasticity of pinion and gear materials respectively. Since the pinion and the gear are made of steel we may make the conclusion that $\mathrm{E}_{\mathrm{tr}}=\mathrm{E}^{\mathrm{p}}=\mathrm{E}^{\mathrm{g}}=2.1 \cdot 10^{5} \mathrm{MPa}$.

Load concentration factor $K_{H \beta}$ is determined according to table 3.1. This factor depends on the disposition of the tooth wheels with respect to bearings and factor $\psi_{b d}=b_{g} / d_{p}$. Since $b^{g}$ and $d^{p}$ were not determined, we find this factor by the following formula:

$$
\psi_{\mathrm{bd}}=\frac{\mathrm{b}^{\mathrm{g}}}{\mathrm{~d}^{\mathrm{p}}}=\frac{0.5 \cdot \mathrm{~b}^{\mathrm{g}}}{\mathrm{a}_{\mathrm{w}}} \cdot(\mathrm{u}+1)=0.5 \cdot \psi_{\mathrm{ba}} \cdot(\mathrm{u}+1)
$$

where the gear face width factor $\psi_{\text {ba }}$ is determined according to table 3.2 depending on the position of the gear relative to bearings taking into account that the value of this factor should correspond to the standard. The greater $\psi_{\text {ba }}$ the less overall dimensions of the gearing. That is why we select the greater magnitude of $\psi_{\text {ba }}$.

The obtained value of $a_{w}$ we round up according to the series given in table 3.3.

In our case ${ }^{*}: \mathrm{T}^{\mathrm{g}}=464300 \mathrm{~N} \cdot \mathrm{~mm} ; \mathrm{T}^{\mathrm{p}}=161120 \mathrm{~N} \cdot \mathrm{~mm} ; \mathrm{u}=4$; $\left[\sigma_{\mathrm{H}}\right]=640 \mathrm{MPa} ; \mathrm{E}_{\mathrm{tr}}=2.1 \cdot 10^{5} \mathrm{MPa} ;\left[\sigma_{\mathrm{b}}\right]=293.657 \mathrm{MPa}$.
(' the initial data in the example are taken randomly, you should take them from the previous calculation)

From table 3.1 we take $\psi_{\text {ba }}=0.5 ; \psi_{b d}=0.5 \cdot 0.5 \cdot(4+1)=1.25$, and
$\mathrm{K}_{\mathrm{H} \beta}=1.073$ (for a symmetrical gear arrangement and tooth surface hardness up to 350 MPa ).

Thus $\quad \mathrm{a}_{\mathrm{w}}=0.75 \cdot(4+1) \cdot \sqrt[3]{\frac{464300 \cdot 1.073 \cdot 2.1 \cdot 10^{5}}{640^{2} \cdot 4^{2} \cdot 0.5}}=118.965 \mathrm{~mm}$
according to table 3.3 we take $\mathrm{a}_{\mathrm{w}}=125 \mathrm{~mm}$ for the further calculations.
4.2. Determine the nominal pitch circle diameter of the gear

$$
\mathrm{d}^{\mathrm{g}}=\frac{2 \cdot \mathrm{a}_{\mathrm{w}} \cdot \mathrm{u}}{\mathrm{u}+1} . \quad \mathrm{d}^{\mathrm{g}}=\frac{2 \cdot 125 \cdot 4}{4+1}=200 \mathrm{~mm} .
$$

4.3. Determine the face width of the gear

$$
\mathrm{b}^{\mathrm{g}}=\psi_{\mathrm{ba}} \cdot \mathrm{a}_{\mathrm{w}} . \quad \mathrm{b}^{\mathrm{g}}=0.5 \cdot 125=62.5 \mathrm{~mm} .
$$

4.4. Determine the normal module according to the strength condition for bending

$$
\mathrm{m}_{\mathrm{n}} \geq \frac{2 \cdot \mathrm{~K}_{\mathrm{m}} \cdot \mathrm{~T}^{\mathrm{g}}}{\mathrm{~d}^{\mathrm{g}} \cdot \mathrm{~b}^{\mathrm{g}} \cdot\left[\sigma_{\mathrm{b}}\right]}
$$

where $K_{m}$ is 5.8 for helical spur gears.
The obtained value of the module should be rounded up according to the standard series given in table 3.4. It is necessary to note that for general-purpose speed reducers, the minimum value of the module is $\mathrm{m}_{\text {min }}=2 \mathrm{~mm}$.

$$
\mathrm{m}_{\mathrm{n}}=\frac{2 \cdot 5.8 \cdot 464300}{200 \cdot 62.5 \cdot 293.657}=1.467 \mathrm{~mm} \text {, round up to } \mathrm{m}_{\mathrm{n}}=2 \mathrm{~mm}
$$

4.5. Determine the helix angle

$$
\beta=\arcsin \left(\frac{3.5 \cdot \mathrm{~m}_{\mathrm{n}}}{\mathrm{~b}^{\mathrm{g}}}\right)=\arcsin \left(\frac{3.5 \cdot 2}{62.5}\right)=6.43=6^{\circ} \angle \nu .
$$

For helical spur gears this angle should be ranged from 8 to $18^{\circ}$. Otherwise, it is necessary to change the normal module $\mathrm{m}_{\mathrm{n}}$ and in our case this condition is not satisfied.

That's why we take $m_{n}=2.5 \mathrm{~mm}$, then

$$
\beta=\arcsin \left(\frac{3.5 \cdot 2.5}{62.5}\right)=8.048=8^{\circ} \angle .
$$

4.6. Determine the total number of teeth

$$
\mathrm{z}_{\mathrm{z}}=\frac{2 \cdot \mathrm{a}_{\mathrm{w}} \cdot \cos \beta}{\mathrm{~m}_{\mathrm{n}}} .
$$

The obtained value of $\mathrm{z}_{\Sigma}$ should be rounded off to the nearest integer number.
4.7. Specify the helix angle according to the integer number of $z_{\Sigma}$

$$
\beta=\arccos \left(\frac{\mathrm{m}_{\mathrm{n}} \cdot \mathrm{z}_{\mathrm{\Sigma}}}{2 \cdot a_{\mathrm{w}}}\right)
$$

The value of this angle must be ranged from 8 to $18^{\circ}$.
4.8. Determine the number of teeth of the pinion

$$
z^{\mathrm{p}}=\frac{\mathrm{z}_{\mathrm{\Sigma}}}{\mathrm{u}+1} \geq \mathrm{z}_{\min }
$$

where $\mathrm{z}_{\min }=17 \cdot \cos ^{3} \beta$ for helical spur gears.
The obtained value of $z^{p}$ should be rounded off to the nearest integer number. If $z^{p}<17 \cdot \cos ^{3} \beta$ it is necessary to decrease the module or to use nonstandard toothed wheels.

In our case

$$
\begin{aligned}
& z_{\Sigma}=\frac{2 \cdot 125 \cdot \cos 8^{\circ} \angle}{2.5}=99, \beta=\arccos \left(\frac{2.5 \cdot 99}{2 \cdot 125}\right)=8.11^{\circ}-\circ^{\circ} v, \\
& z^{\mathrm{p}}=\frac{99}{4+1}=19.8 \Rightarrow z^{\mathrm{p}}=20>\mathrm{z}_{\min }=17 \cdot \cos ^{3} 8^{\circ} v-16.5 .
\end{aligned}
$$

4.9. Determine the number of teeth of the gear

$$
z^{g}=z_{\Sigma}-z^{p}, \quad z^{g}=99-20=79
$$

4.10. Specify the velocity ratio of the gearing

$$
\mathrm{u}_{\mathrm{act}}=\frac{\mathrm{z}^{\mathrm{g}}}{\mathrm{z}^{\mathrm{p}}} .
$$

The error $\varepsilon=\left|\frac{\mathrm{u}_{\text {act }}-\mathrm{u}}{\mathrm{u}}\right| \cdot 100 \%$ should be less then or equal to $4 \%$. Otherwise the number of teeth $\mathrm{z}^{\mathrm{p}}, \mathrm{z}^{\mathrm{g}}$ and $\mathrm{z}_{\Sigma}$ must be rounded down.

In our case the condition is satisfied, as

$$
\mathrm{u}_{\mathrm{act}}=\frac{79}{20}=3.95 ; \quad \varepsilon=\left|\frac{3.95-4}{4}\right| \cdot 100 \%=1.25<4 \% .
$$

4.11. Determine the nominal pitch circles diameters for the pinion and the gear

$$
\begin{gathered}
\mathrm{d}^{\mathrm{p}}=\frac{\mathrm{m}_{\mathrm{n}}}{\cos \beta} \cdot \mathrm{z}^{\mathrm{p}}=\frac{2.5}{\cos 8^{\circ} \mathrm{u}} \cdot \rightarrow 0=50.5 \mathrm{~mm}, \\
\mathrm{~d}^{\mathrm{g}}=2 \cdot a_{\mathrm{w}}-\mathrm{d}^{\mathrm{p}}=2 \cdot 125-50.5=199.5 \mathrm{~mm} .
\end{gathered}
$$

4.12. Determine the addendum circles diameters for the pinion and the gear

$$
\begin{gathered}
\mathrm{d}_{\mathrm{a}}^{\mathrm{p}}=\mathrm{d}^{\mathrm{p}}+2 \mathrm{~m}_{\mathrm{n}}=50.5+2 \cdot 2.5=55.5 \mathrm{~mm} \\
\mathrm{~d}_{\mathrm{a}}^{\mathrm{g}}=\mathrm{d}^{\mathrm{g}}+2 \mathrm{~m}_{\mathrm{n}}=199.5+2 \cdot 2.5=204.5 \mathrm{~mm} .
\end{gathered}
$$

4.13. Determine the dedendum circles diameters for the pinion and the gear

$$
\begin{gathered}
d_{f}^{p}=d^{p}-2.5 \cdot \mathrm{~m}_{\mathrm{n}}=50.5-2.5 \cdot 2.5=44.25 \mathrm{~mm}, \\
\mathrm{~d}_{\mathrm{f}}^{\mathrm{g}}=\mathrm{d}^{\mathrm{g}}-2.5 \cdot \mathrm{~m}_{\mathrm{n}}=199.5-2.5 \cdot 2.5=193.25 \mathrm{~mm} .
\end{gathered}
$$

4.14. Determine forces that act in the engagement of the helical spur gears:

- turning force $\mathrm{F}_{\mathrm{t}}=\frac{2 \cdot \mathrm{~T}^{\mathrm{g}}}{\mathrm{d}^{\mathrm{g}}}=\frac{2 \cdot 464300}{199.5}=4654.64 \mathrm{~N} ;$
- radial force $F_{r}=\frac{F_{t}}{\cos \beta} \cdot \operatorname{tg} \alpha_{w}=\frac{4654.64}{\cos 8^{\circ} u} \cdot \operatorname{tg} 20^{\circ}-1,11.22 N$;
- axial force $F_{a}=F_{t} \cdot \operatorname{tg} \beta=4654.64 \cdot \operatorname{tg} 8^{\circ} u-v 62.45 N$, where $\alpha_{w}=20^{\circ}$ is the pressure angle for the pitch circle.
4.15. Determine the maximum contact stress developed in the contact zone of teeth

$$
\sigma_{H}=1.18 \cdot Z_{H \beta} \cdot \sqrt{\frac{T^{p} \cdot K_{H} \cdot E_{t r}}{\left(d^{p}\right)^{2} \cdot b^{g} \cdot \sin 2 \alpha_{w}} \cdot\left(\frac{u_{\text {act }}+1}{u_{\text {act }}}\right)},
$$

where $\mathrm{Z}_{\mathrm{H} \beta}$ takes into account rising contact strength of the helical spur gears in comparison with the straight spur gears; $\mathrm{T}^{\mathrm{p}}$ is the torque at the pinion shaft in $\mathrm{N} \cdot \mathrm{mm} ; \mathrm{K}_{\mathrm{H}}$ is the design load factor that is determined as

$$
\mathrm{K}_{\mathrm{H}}=\mathrm{K}_{\mathrm{H} \beta} \cdot \mathrm{~K}_{\mathrm{HV}},
$$

where $K_{H \beta}$ is the load concentration factor; $K_{H V}$ is the dynamic load factor.

The load concentration factor $\mathrm{K}_{\mathrm{H} \beta}$ is specified in table 3.2 and depends upon $\psi_{b d}=\frac{b^{g}}{d^{p}}$.

In order to determine $\mathrm{K}_{\mathrm{HV}}$ it is necessary to find the peripheral speed $V^{g}$ of the gear

$$
V^{\mathrm{g}}=\frac{\omega^{\mathrm{g}} \cdot \mathrm{~d}^{\mathrm{g}}}{2}
$$

and the accuracy of the gearing (table 3.5), where $\omega^{\mathrm{g}}$ is the angular velocity of the gear.

The dynamic load factor $\mathrm{K}_{\mathrm{HV}}$ is specified in table 3.6.
Factor $\mathrm{Z}_{\mathrm{H} \beta}$ is determined in the following way

$$
\mathrm{Z}_{\mathrm{H} \beta}=\sqrt{\frac{\mathrm{K}_{\mathrm{H} \alpha} \cdot \cos ^{2} \beta}{\varepsilon_{\alpha}}},
$$

where $\mathrm{K}_{\mathrm{H} \alpha}$ takes into account non-uniform load distribution between several pairs of teeth; $\varepsilon_{\alpha}$ is the contact ratio.
$\mathrm{K}_{\mathrm{H} \alpha}$ depends upon the accuracy of manufacturing and the peripheral speed and is determined according to table 4.1.

Table 4.1
Factors $\mathbf{K}_{\mathbf{H} \alpha}, \mathbf{K}_{\mathrm{b} \alpha}$ that take into account non-uniform load distribution between some pairs of teeth

| Peripheral speed V, <br> $\mathrm{m} / \mathrm{sec}$ | Accuracy <br> degree | $\mathrm{K}_{\mathrm{H} \alpha}$ | $\mathrm{K}_{\mathrm{b} \alpha}$ |
| :---: | :---: | :---: | :---: |
| To 5 | 7 | 1.03 | 1.07 |
|  | 8 | 1.07 | 1.22 |
|  | 9 | 1.13 | 1.35 |
| From 5 to 10 | 7 | 1.05 | 1.2 |
|  | 8 | 1.10 | 1.3 |
| From 10 to 15 | 7 | 1.08 | 1.25 |
|  | 8 | 1.15 | 1.40 |

Contact ratio $\varepsilon_{\alpha}$ is found by the following formula

$$
\varepsilon_{\alpha}=\left[1.88-3.2 \cdot\left(\frac{1}{\mathrm{z}^{\mathrm{p}}}+\frac{1}{\mathrm{z}^{\mathrm{g}}}\right)\right] \cdot \cos \beta .
$$

The obtained value of $\sigma_{\mathrm{H}}$ should meet the following condition:

$$
\sigma_{\mathrm{H}}=(0.8 \ldots 1.1) \cdot\left[\sigma_{\mathrm{H}}\right] .
$$

Otherwise it is necessary to change the center distance $a_{\mathrm{w}}$ and recalculate the gearing.

In our case: $\psi_{b d}=\frac{62.5}{50.5}=1.238 ; \mathrm{K}_{\mathrm{H} \beta}=1.072$;

$$
\mathrm{V}^{\mathrm{g}}=\frac{19.19 \cdot 0.1995}{2}=1.914 \mathrm{~m} / \mathrm{sec} \Rightarrow \mathrm{~K}_{\mathrm{HV}}=1.01 ;
$$

The accuracy of gear drive of manufacturing is $9 ; K_{H}=$ $1.072 \cdot 1.01=1.083$;

$$
\begin{aligned}
& \varepsilon_{\alpha}=\left[1.88-3.2 \cdot\left(\frac{1}{20}+\frac{1}{79}\right)\right] \cdot \cos 8^{\circ} u-1.663 \mathrm{~K}_{\mathrm{H} \alpha}=1.13 ; \\
& \mathrm{Z}_{\mathrm{H} \beta}=\sqrt{\frac{1.13 \cdot \cos ^{2} 8^{\circ} \mathrm{u}}{1.663}}=0.816 ;
\end{aligned}
$$

$$
\begin{gathered}
\sigma_{H}=1.18 \cdot 0.816 \cdot \sqrt{\frac{161120 \cdot 1.083 \cdot 210000}{50.5^{2} \cdot 62.5 \cdot \sin 2 \cdot 20^{\circ}} \cdot\left(\frac{3.95+1}{3.95}\right)}=644.63 \mathrm{MPa} ; \\
\sigma_{H}<1.1\left[\sigma_{H}\right] \text { so the strength condition is satisfied. }
\end{gathered}
$$

4.16. Determine the maximum bending stress

$$
\sigma_{\mathrm{b}}=\frac{\mathrm{F}_{\mathrm{t}} \cdot \mathrm{~K}_{\mathrm{b} \beta} \cdot \mathrm{~K}_{\mathrm{bv}} \cdot \mathrm{Z}_{\mathrm{b} \beta} \cdot \mathrm{Y}_{\mathrm{b}}}{\mathrm{~m}_{\mathrm{n}} \cdot \mathrm{~b}^{\mathrm{g}}} \leq\left[\sigma_{\mathrm{b}}\right],
$$

where $\mathrm{K}_{\mathrm{b} \beta}$ is the load concentration factor that is determined according to table 3.7; $\mathrm{K}_{\mathrm{bv}}$ is the dynamic load factor specified in table $3.8 ; \mathrm{Y}_{\mathrm{b}}$ is the tooth shape factor that is determined in table 3.9 ; it depends on the number of teeth of the equivalent straight spur gear $z_{v}^{g}=\frac{z^{g}}{\cos ^{3} \beta}$ for the case when the shift factor $\mathrm{x}=0$.

The factor $\mathrm{Z}_{\mathrm{b} \beta}$ is the analogy of $\mathrm{Z}_{\mathrm{H} \beta}$ and is determined as

$$
\mathrm{Z}_{\mathrm{b} \beta}=\frac{\mathrm{K}_{\mathrm{b} \alpha} \cdot \mathrm{Y}_{\beta}}{\varepsilon_{\alpha}},
$$

where $K_{b \alpha}$ is chosen from table 4.1; $\quad Y_{\beta}=1-\frac{\beta^{\circ}}{140}$ is the correction factor.

If obtained value is of $\sigma_{b}>\left[\sigma_{b}\right]$ it is necessary to increase the module.

$$
\begin{gathered}
\text { In our case: } \mathrm{K}_{\mathrm{b} \beta}=1.155 ; \mathrm{K}_{\mathrm{bv}}=1.02 ; \mathrm{z}_{\mathrm{v}}^{\mathrm{g}}=\frac{79}{\cos ^{3} 8^{\circ} \mathrm{v}}=81.42 \Rightarrow 81 ; \\
\mathrm{Y}_{\mathrm{b}}=3.61 ; \mathrm{K}_{\mathrm{b} \alpha}=1.35 ; \mathrm{Y}_{\beta}=1-\frac{8^{\circ}+\mathrm{v}}{140}=0.939 ; \\
\mathrm{Z}_{\mathrm{b} \beta}=\frac{1.35 \cdot 0.939}{1.663}=0.762 ; \\
\sigma_{\mathrm{b}}=\frac{4654.64 \cdot 1.155 \cdot 1.02 \cdot 0.762 \cdot 3.61}{2.5 \cdot 62.5}=96.54 \mathrm{MPa}<\left[\sigma_{\mathrm{b}}\right]=293.657 \mathrm{MPa} .
\end{gathered}
$$

Strength condition is satisfied.

## 5. STRENGTH CALCULATION OF THE BEVEL GEAR

Initial data: torque at the gear shaft $T^{g}=460 \mathrm{~N} \cdot \mathrm{~m}$; velocity ratio of the gearing $\mathrm{u}=3$; allowable contact stress $\left[\sigma_{\mathrm{H}}\right]=620 \mathrm{MPa}$; allowable bending stress $\left[\sigma_{b}\right]=168 \mathrm{MPa}$, hardness of the gear material $\mathrm{H}^{\mathrm{g}}=285 \mathrm{BHN}$.
("the initial data in the example are taken randomly, you should take them from the previous calculation)
5.1. Determine the external pitch diameter of the gear

$$
\mathrm{d}_{\mathrm{e}}^{\mathrm{g}}=1.7 \cdot \sqrt[3]{\frac{\mathrm{T}^{\mathrm{g}} \cdot \mathrm{~K}_{\mathrm{HB}} \cdot \mathrm{E}_{\mathrm{tr}} \cdot \mathrm{u}}{v_{\mathrm{H}} \cdot\left[\sigma_{\mathrm{H}}\right]^{2} \cdot \psi_{\mathrm{bR}} \cdot\left(1-\psi_{\mathrm{bR}}\right)}},
$$

where $\mathbf{T}^{\mathbf{g}}$ is the torque on the gear shaft in $\mathrm{N} \cdot \mathrm{mm} ; \mathbf{E}_{\text {tr }}$ is the transformed modulus of elasticity; $\mathbf{K}_{\mathbf{H} \boldsymbol{\beta}}$ is the load concentration factor; $\mathbf{u}$ is the velocity ratio; $\mathbf{v}_{\mathbf{H}}=0.85$ is the correction factor that takes into account reducing bevel gears strength in comparison with the spur gears; $\left[\sigma_{\mathbf{H}}\right]$ is the allowable contact stress; $\psi_{b R}=b^{g} / R_{e}$ is the gear face width factor that determines proportions of the face width of the gear with respect to the external cone distance. Factor $\psi_{\mathrm{bR}}$ must be less than 0.3 . Recommended value of $\psi_{\mathrm{bR}}=0.285$.

Since both pinion and gear are made of steel, the transformed modulus of elasticity $\mathrm{E}_{\mathrm{tr}}=2.1 \cdot 10^{5} \mathrm{MPa}$.

The load concentration factor $\mathrm{K}_{\mathrm{H} \beta}$ depends upon the hardness of the gear material. If $\mathrm{H}^{\mathrm{g}} \leq 350 \mathrm{BHN}, \mathrm{K}_{\mathrm{H} \beta}$ is ranged from 1.23 to 1.35 . Otherwise $\left(\mathrm{H}^{\mathrm{g}}>350 \mathrm{BHN}\right) \mathrm{K}_{\mathrm{H} \beta}$ ranges from1.25 to 1.45 . It is necessary to note that greater values of $\mathrm{K}_{\mathrm{H} \beta}$ are intended for the case when one of tooth wheels is on the cantilever shaft. Let us take $\mathrm{K}_{\mathrm{H} \beta}=1.3$

$$
\mathrm{d}_{\mathrm{e}}^{\mathrm{g}}=1.7 \cdot \sqrt[3]{\frac{\mathrm{T}^{\mathrm{g}} \cdot \mathrm{~K}_{H \beta} \cdot \mathrm{E}_{\mathrm{tr}} \cdot \mathrm{u}}{v_{\mathrm{H}} \cdot\left[\sigma_{\mathrm{H}}\right]^{2} \cdot \psi_{\text {bR }} \cdot\left(1-\psi_{\text {bR }}\right)}}=1,7 \cdot \sqrt[3]{\frac{460 \cdot 10^{3} \cdot 1.3 \cdot 2.1 \cdot 10^{5} \cdot 3}{0.85 \cdot 620^{2} \cdot 0.285 \cdot(1-0.285)}}=302.9 \mathrm{~mm} .
$$

The obtained value of $\mathrm{d}_{\mathrm{e}}^{\mathrm{g}}$ should be rounded up according to standard series given in table 5.1. In our case we assume $\mathrm{d}_{\mathrm{e}}^{\mathrm{g}}=315 \mathrm{~mm}$.

Table 5.1
Standard values of the external pitch diameter $\mathrm{d}_{\mathrm{e}}^{\mathbf{g}}$

| Series 1 | 40 | 50 | 63 | 80 | 100 | 125 | 160 | 200 | 250 | 315 | 400 | 500 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Series 2 | - | - | 71 | 90 | 112 | 140 | 180 | 224 | 280 | 355 | 450 | 560 |

5.2. Determine pitch angles for the pinion and the gear.

$$
\begin{aligned}
& \delta_{2}=\operatorname{arctg} u=\operatorname{arctg} 3=71^{\circ} 36^{\prime}, \\
& \delta_{1}=90^{\circ}-\delta_{2}=90-71.6=18^{\circ} 24^{\prime} .
\end{aligned}
$$

5.3. Determine the external cone distance

$$
\mathrm{R}_{\mathrm{e}}=\frac{\mathrm{d}_{\mathrm{e}}^{\mathrm{g}}}{2 \cdot \sin \delta_{2}}=\frac{315}{2 \cdot \sin 71^{\circ} 36^{\prime}}=165.98 \mathrm{~mm} .
$$

5.4. Determine the face width of the gear

$$
\mathrm{b}^{\mathrm{g}}=\psi_{\mathrm{bR}} \cdot \mathrm{R}_{\mathrm{e}}=0.285 \cdot 165.98=47.3 \mathrm{~mm} .
$$

5.5. Determine the external module

$$
\mathrm{m}_{\mathrm{e}}=\frac{14 \cdot \mathrm{~T}^{\mathrm{g}} \cdot \mathrm{~K}_{\mathrm{b} \beta}}{v_{\mathrm{b}} \cdot \mathrm{~d}_{\mathrm{e}}^{\mathrm{g}} \cdot \mathrm{~b}^{\mathrm{g}} \cdot\left[\sigma_{\mathrm{b}}\right]}=\frac{14 \cdot 460 \cdot 10^{3} \cdot 1,32}{0.85 \cdot 315 \cdot 47.3 \cdot 168}=3,99 \mathrm{~mm}
$$

where $\mathbf{v}_{\mathbf{b}}=0.85$ is the correction factor; $\mathbf{K}_{\mathbf{b} \beta}$ is the load concentration factor that is determined according to table 3.7 and depends upon $\psi_{b d}$ factor, where the latter is found as

$$
\psi_{\mathrm{bd}}=\frac{\mathrm{b}^{\mathrm{g}}}{\mathrm{~d}_{\mathrm{m}}^{\mathrm{p}}}=0.166 \cdot \sqrt{\mathrm{u}^{2}+1}=0.166 \cdot \sqrt{3^{2}+1}=0.53 .
$$

Let us take $K_{B \beta}=1.32$ (for gear arrangement on cantilevers, mounted on roller bearings).
5.6. Determine the number of the gear teeth

$$
\mathrm{z}^{\mathrm{g}}=\frac{\mathrm{d}_{\mathrm{e}}^{\mathrm{g}}}{\mathrm{~m}_{\mathrm{e}}}=\frac{315}{3.99}=78,9
$$

and round off $z^{g}$ to the integer number. In our case $z^{g}=79$.
5.7. Determine the number of the pinion teeth

$$
z^{p}=\frac{z^{g}}{u}=\frac{79}{3}=26.3
$$

and round off $z^{p}$ to the integer number too. In our case $z^{p}=26$.
5.8. Specify the velocity ratio of the gearing

$$
\mathrm{u}_{\mathrm{act}}=\frac{\mathrm{z}^{\mathrm{g}}}{\mathrm{z}^{\mathrm{p}}}=\frac{78}{26}=3.04 .
$$

The error $\varepsilon=\left|\frac{\mathrm{u}_{\text {act }}-\mathrm{u}}{\mathrm{u}}\right| \cdot 100 \%$ must be less then or equal to $4 \%$. Otherwise, we should round down values of $z^{p}$ and $z^{g}$.

$$
\text { In this case } \varepsilon=\left|\frac{\mathrm{u}_{\text {act }}-\mathrm{u}}{\mathrm{u}}\right| \cdot 100 \%=\left|\frac{3.04-3}{3}\right| \cdot 100 \%=1.33<4 \% \text {. }
$$

5.9. Specify pitch angles for the pinion and the gear

$$
\begin{gathered}
\delta_{2}=\operatorname{arctg} \mathrm{u}_{\mathrm{act}}=\operatorname{arctg} 3.04=71^{\circ} 48^{\prime}, \\
\delta_{1}=90^{\circ}-\delta_{2}=18^{\circ} 12^{\prime}
\end{gathered}
$$

5.10. Determine external pitch diameters of the pinion and the gear.

$$
\begin{gathered}
d_{e}^{p}=m_{e} \cdot z^{p}=3.99 \cdot 26=103.74 \mathrm{~mm} \\
d_{e}^{\mathrm{g}}=\mathrm{m}_{\mathrm{e}} \cdot \mathrm{z}^{\mathrm{g}}=3.99 \cdot 79=315.21 \mathrm{~mm}
\end{gathered}
$$

5.11. Determine diameters of addendum circles at the outer section for the pinion and the gear

$$
\begin{gathered}
\mathrm{d}_{\mathrm{ae}}^{\mathrm{p}}=\mathrm{d}_{\mathrm{e}}^{\mathrm{p}}+2 \cdot \mathrm{~m}_{\mathrm{e}} \cdot \cos \delta_{1}=103.74+2 \cdot 3.99 \cdot \cos 18^{\circ} 12^{\prime}=111.32 \mathrm{~mm}, \\
\mathrm{~d}_{\mathrm{ae}}^{\mathrm{g}}=\mathrm{d}_{\mathrm{e}}^{\mathrm{g}}+2 \cdot \mathrm{~m}_{\mathrm{e}} \cdot \cos \delta_{2}=315.21+2 \cdot 3.99 \cdot \cos 71^{\circ} 48^{\prime}=317.70 \mathrm{~mm} .
\end{gathered}
$$

5.12. Determine diameters of dedendum circles in the outer section for the pinion and the gear.

$$
\begin{gathered}
\mathrm{d}_{\mathrm{fe}}^{\mathrm{p}}=\mathrm{d}_{\mathrm{e}}^{\mathrm{p}}-2.4 \cdot \mathrm{~m}_{\mathrm{e}} \cdot \cos \delta_{1}=103.74-2.4 \cdot 3.99 \cdot \cos 18^{\circ} 12^{\prime}=94.64 \mathrm{~mm}, \\
\mathrm{~d}_{\mathrm{fe}}^{\mathrm{g}}=\mathrm{d}_{\mathrm{e}}^{\mathrm{g}}-2.4 \cdot \mathrm{~m}_{\mathrm{e}} \cdot \cos \delta_{2}=315.21-2.4 \cdot 3.99 \cdot \cos 71^{\circ} 48^{\prime}=312.22 \mathrm{~mm} .
\end{gathered}
$$

5.13. Specify the external cone distance

$$
\mathrm{R}_{\mathrm{e}}=0.5 \cdot \mathrm{~m}_{\mathrm{e}} \cdot \sqrt{\left(\mathrm{z}^{\mathrm{p}}\right)^{2}+\left(\mathrm{z}^{\mathrm{g}}\right)^{2}}=0.5 \cdot 3.99 \cdot \sqrt{26^{2}+79^{2}}=165.92 \mathrm{~mm} .
$$

5.14. Specify the face width of the gear

$$
b^{\mathrm{g}}=\psi_{\mathrm{bR}} \cdot \mathrm{R}_{\mathrm{e}}=0.285 \cdot 165.92=47.23 \mathrm{~mm} .
$$

5.15. Determine mean pitch diameters for the pinion and for the gear

$$
\begin{aligned}
& d_{m}^{p}=\frac{d_{e}^{p} \cdot\left(R_{e}-0.5 \cdot b^{g}\right)}{R_{e}}=d_{e}^{p} \cdot\left(1-0.5 \cdot \psi_{b R}\right)=103.74 \cdot(1-0.5 \cdot 0.285)=88.96 \mathrm{~mm} \\
& d_{m}^{g}=\frac{d_{e}^{g} \cdot\left(R_{e}-0.5 \cdot b^{\mathrm{g}}\right)}{R_{e}}=d_{e}^{\mathrm{g}} \cdot\left(1-0.5 \cdot \psi_{b R}\right)=315.21 \cdot(1-0.5 \cdot 0.285)=270.29 \mathrm{~mm}
\end{aligned}
$$

5.16. Determine the forces that act in the engagement of the bevel gears

- turning force

$$
\mathrm{F}_{\mathrm{t}}=\frac{2 \cdot \mathrm{~T}^{\mathrm{g}}}{\mathrm{~d}_{\mathrm{m}}^{\mathrm{g}}}=\frac{2 \cdot 420 \cdot 10^{3}}{270.29}=3108 \mathrm{~N}
$$

- radial force at the gear

$$
\mathrm{F}_{\mathrm{r}}^{\mathrm{g}}=\mathrm{F}_{\mathrm{t}} \cdot \operatorname{tg} \alpha_{\mathrm{w}} \cdot \cos \delta_{2}=3108 \cdot \operatorname{tg} 20^{\circ} \cdot \cos 71^{\circ} 48^{\prime}=353.3 \mathrm{~N}
$$

- axial force at the gear

$$
F_{a}^{g}=F_{t} \cdot \operatorname{tg} \alpha_{w} \cdot \sin \delta_{2}=3108 \cdot \operatorname{tg} 20^{\circ} \cdot \sin 71^{\circ} 48^{\prime}=1074.4 \mathrm{~N} .
$$

5.17. Determine the maximum contact stress that develops in the contact zone of teeth:

$$
\begin{aligned}
& \sigma_{\mathrm{H}}=1.18 \cdot \sqrt{\frac{\mathrm{~T}^{\mathrm{p}} \cdot \mathrm{~K}_{\mathrm{H}} \cdot \mathrm{E}_{\mathrm{tr}}}{v_{\mathrm{H}} \cdot\left(\mathrm{~d}_{\mathrm{m}}^{\mathrm{p}}\right)^{2} \cdot \mathrm{~b}^{\mathrm{g}} \cdot \sin 2 \alpha_{\mathrm{w}}} \cdot\left(\frac{\sqrt{\mathrm{u}_{\text {act }}^{2}+1}}{\mathrm{u}_{\text {act }}}\right)}= \\
& =1.18 \cdot \sqrt{\frac{153 \cdot 10^{3} \cdot 1.29 \cdot 2.1 \cdot 10^{5}}{0.85 \cdot 88.96^{2} \cdot 47.23 \cdot \sin 40^{\circ}} \cdot\left(\frac{\sqrt{3.04^{2}+1}}{3.04}\right)}=545.3 \mathrm{MPa},
\end{aligned}
$$

where $\mathrm{T}^{\mathrm{p}}$ is measured in $\mathrm{N} \cdot \mathrm{mm} ; \mathrm{K}_{\mathrm{H}}$ is the design load factor, determined as

$$
\mathrm{K}_{\mathrm{H}}=\mathrm{K}_{\mathrm{H} \beta} \cdot \mathrm{~K}_{\mathrm{HV}} .
$$

The load concentration factor $\mathrm{K}_{\mathrm{H} \beta}$ is specified according to table 3.2 which depends upon factor $\psi_{\mathrm{bd}}=\frac{\mathrm{b}^{\mathrm{g}}}{\mathrm{d}_{\mathrm{m}}^{\mathrm{p}}}$.

The dynamic load factor $K_{H V}$ is determined according to table 3.6 and depends upon the peripheral speed of the gear $\left(V^{g}=\frac{\omega^{g} \cdot d_{m}^{g}}{2}\right)$ and the accuracy of manufacturing (table 3.5). If we use table 3.6 for bevel gears we should reduce the accuracy of manufacturing by 1 .

In this case $\psi_{b d}=\frac{b^{\mathrm{g}}}{\mathrm{d}_{\mathrm{m}}^{\mathrm{p}}}=\frac{47.23}{88.96}=0.53, \mathrm{~V}^{\mathrm{g}}=\frac{\omega^{\mathrm{g}} \cdot \mathrm{d}_{\mathrm{m}}^{\mathrm{g}}}{2}=\frac{25 \cdot 0.27}{2}=3.4 \mathrm{~m} / \mathrm{sec}$. $\mathrm{K}_{\mathrm{H}}=\mathrm{K}_{\mathrm{H} \beta} \cdot \mathrm{K}_{\mathrm{HV}}=1.16 \cdot 1.11=1.29$.

The obtained value of $\sigma_{\mathrm{H}}$ must correspond to the following condition

$$
\sigma_{H}=(0.8 \ldots 1.1) \cdot\left[\sigma_{H}\right]=(0.8 \ldots 1.1) \cdot 620=496 \ldots 682 \mathrm{MPa} .
$$

Otherwise it is necessary to change the external pitch diameter and make calculation once more.
5.18. Determine the maximum bending stress

$$
\sigma_{\mathrm{b}}=\frac{\mathrm{F}_{\mathrm{t}} \cdot \mathrm{~K}_{\mathrm{b} \beta} \cdot \mathrm{~K}_{\mathrm{bv}} \cdot \mathrm{Y}_{\mathrm{b}}}{v_{\mathrm{b}} \cdot \mathrm{~m}_{\mathrm{m}} \cdot \mathrm{~b}^{\mathrm{g}}}=\frac{3108 \cdot 1.32 \cdot 1.27 \cdot 3.6}{0.85 \cdot 3.42 \cdot 47.23}=136.6 \mathrm{MPa} \leq\left[\sigma_{\mathrm{b}}\right]=168 \mathrm{MPa}
$$

where $K_{b \beta}$ is the load concentration factor defined according to table 3.7; $\mathrm{K}_{\mathrm{bv}}$ is the dynamic load factor given in table 3.8 (for bevel gears we should reduce the degree of accuracy by 1 ); $\mathrm{Y}_{\mathrm{b}}$ is the tooth shape factor that is defined according to table 3.9 depends upon the number of teeth of the equivalent straight spur gear $z_{v}^{g}=\frac{z^{g}}{\cos \delta_{2}}=\frac{79}{\cos 71^{\circ} 48^{\prime}}=253$ for the case when the offset factor $\mathrm{x}=0$;
$v_{b}=0.85$ is the correction factor; $\mathrm{m}_{\mathrm{m}}=\frac{\mathrm{d}_{\mathrm{m}}^{\mathrm{g}}}{\mathrm{z}^{\mathrm{g}}}=\frac{270.29}{79}=3.42 \mathrm{~mm}$ is the mean module.

## 6. ANALYSIS AND DESIGN OF SHAFTS

6.1. Find the minimum diameter of speed reducer shafts

$$
\mathrm{d}_{\min }=\sqrt[3]{\frac{\mathrm{T}}{0.2 \cdot[\tau]}},
$$

where T is the torque on the shaft is measured in $\mathrm{N} \cdot \mathrm{mm}$; $[\tau]$ is the allowable torsion stress in MPa .

In order to compensate action of bending stresses, the allowable tangential stress is considered as down rated. For steels $[\tau]=15 \ldots 20$ MPa .

The obtained value of $\mathrm{d}_{\text {min }}$ is rounded up according to the following standard series: $20,21,22,23,24,25,26,28,30,32,34,36,38,40,42$, $45,48,50,52,55,58,60,65,70,75,80,85,90,95,100,105,110,115$, $120,130,140,150$.

As a rule in general-purpose speed reducers the stepped shafts with a solid cross-section are used.

### 6.1.1. Input shaft

For the input shaft $\mathrm{d}_{\text {min }}$ is the diameter of the shaft cantilever portion where such elements as a half coupling, a pulley, a sprocket or a pinion may be mounted (Fig. 6.1, 6.2). In order to fix the above mentioned elements in the axial direction we use a shoulder which height $t_{1}$ may be ranged from 2 to 5 mm depending on the shaft diameter. Recommended values of $\mathrm{t}_{1}$ are given in table 6.1.

Fig.6.1. Spur gearing input shaft construction

Fig. 6.2. Bevel pinion shaft construction
The next section of the shaft with the diameter $\mathrm{d}_{2}=\mathrm{d}_{1}+2 \cdot \mathrm{t}_{1}$ (the value of $d_{2}$ must correspond to the standard series) is for seal installation. Seals are used to protect bearing assemblies from dust and dirt accumulation as well as lubrication leakage from the bearings. For general-purpose speed reducer commercial seals are used more frequently.

In order to reduce friction between the seal and the shaft, the corresponding section should be polished. For this purpose this section is additionally surface hardened to 45-50 HRC.

Table 6.1
Recommended values of $t_{1}$ and $t_{2}$

| $d, \mathrm{~mm}$ | $20-50$ | $55-120$ |
| :---: | :---: | :---: |
| $t_{1}, \mathrm{~mm}$ | $2 ; 2.5$ | 5 |
| $t_{2}, \mathrm{~mm}$ | $1 ; 1.5$ | 2.5 |

The next shaft section is used for mounting of the bearing. The diameter of this section is determined as

$$
\mathrm{d}_{3}=\mathrm{d}_{2}+2 \cdot \mathrm{t}_{2},
$$

where $t_{2}$ is the height of the shoulder that is used for differentiation of shaft surfaces by hardness and roughness. Recommended values of $t_{2}$ are given in table 6.1. It is necessary to note that $t_{2}$ should be chosen to obtain shaft diameter $d_{3}$ ended by 0 or 5 . It is explained by the fact that the bearings are standard elements with the inner ring diameter value must be a multiple of 5 .

Bearings must be fixed in the axial direction. That is why the
diameter of the next section of the shaft, where a pinion or gear is installed, is determined as

$$
\mathrm{d}_{4}=\mathrm{d}_{3}+2 \cdot \mathrm{t}_{1} .
$$

The obtained value of $\mathrm{d}_{4}$ must correspond to standard series.
A pinion may be made either as integral with the shaft or as a separate part. In order to increase shaft strength and rigidity it is recommended to use pinion shafts.

The last section of the shaft is for installing the second bearing. The diameter of this section must be the same as the diameter of the first bearing. In our case it is $\mathrm{d}_{3}$.

### 6.1.2. Output shaft

The output shaft has the same design as the input one. But in contrast to the latter a gear is mounted on the shaft section of diameter $\mathrm{d}_{4}$ (Fig. 6.3). In order to fix the gear in the axial direction we should provide the shoulder height $t_{1}$. That is why the diameter of the next section of the shaft is $\mathrm{d}_{5}=\mathrm{d}_{4}+2 \cdot \mathrm{t}_{1}$.

For our case we have to design the output shaft where a helical spur gear is mounted. We will have the following diameters:

$$
\mathrm{d}_{\min }=\sqrt[3]{\frac{400 \cdot 10^{3}}{0.2 \cdot[20]}}=46,4 \mathrm{~mm} \text {, that's why } \mathrm{d}_{1}=48 \mathrm{~mm} \text { (according }
$$

to the standard series);
Gear

Fig. 6.3. Output shaft

$$
\begin{gathered}
\mathrm{d}_{2}=\mathrm{d}_{1}+2 \cdot \mathrm{t}_{1}=48+2 \cdot 2.5=53 \mathrm{~mm}, \mathrm{~d}_{2}=55 \mathrm{~mm} ; \\
\mathrm{d}_{3}=\mathrm{d}_{2}+2 \cdot \mathrm{t}_{2}=55+2 \cdot 2.5=60 \mathrm{~mm} ; \\
\mathrm{d}_{4}=\mathrm{d}_{3}+2 \cdot \mathrm{t}_{1}=60+2 \cdot 5=70 \mathrm{~mm} ;
\end{gathered}
$$

$$
\mathrm{d}_{5}=\mathrm{d}_{4}+2 \cdot \mathrm{t}_{1}=70+2 \cdot 5=80 \mathrm{~mm} .
$$

6.2. Determine the sizes of elements that are installed on the shaft.
6.2.1. Pinion.

Face width of the pinion

$$
b^{\mathrm{p}}=\mathrm{b}^{\mathrm{g}}+5 .
$$

6.2.2. Spur and bevel gears (Fig.6.4, $a, b$ )

- thickness of the rim
- thickness of the web
- diameter of the hub
- length of the hub
- diameter of the rim
- diameter of the hole
- diameter of the hole centre line

$$
\begin{aligned}
& \delta=(3 \ldots 4) \cdot \mathrm{m} ; \quad \delta \geq 8 \mathrm{~mm} ; \\
& \mathrm{C}=(0.2 \ldots 0.3) \cdot \mathrm{b}^{\mathrm{g}} ; \\
& \mathrm{d}_{\text {hub }}=(1.5 \ldots 1.7) \cdot \mathrm{d}_{\text {shat }} ; \\
& \mathrm{l}_{\text {hub }}=(1.2 \ldots 1.5) \cdot \mathrm{d}_{\text {shaft }} ; \\
& \mathrm{D}_{0}=\mathrm{d}_{\mathrm{f}}-2 \delta ; \\
& \mathrm{d}_{\text {hole }}=\frac{\mathrm{D}_{0}-\mathrm{d}_{\text {hub }}}{4} ; \\
& \mathrm{D}_{\mathrm{c}}=\frac{\mathrm{D}_{0}+\mathrm{d}_{\text {hub }}}{2} ;
\end{aligned}
$$

- fillet radii $\mathrm{R} \geq 6 \mathrm{~mm}$ and angle $\gamma \geq 7^{\circ}$.

$a$

b

Fig.6.4. Spur gear (a), bevel gear (b)

## 7. CALCULATION OF KEYED JOINTS.

The dimensions of keys are chosen according to table 7.1 which depends on the shaft diameter. The length of the key must be less than the hub length by $5 \ldots 10 \mathrm{~mm}$ and correspond to the standard series.

In general-purpose speed reducer, keyed joints are usually analyzed to prevent bearing stresses.

$$
\sigma_{\text {bear }}=\frac{2 \cdot \mathrm{~T}}{\mathrm{~d} \cdot\left(\mathrm{~h}-\mathrm{t}_{1}\right) \cdot l_{\mathrm{d}}} \leq\left[\sigma_{\text {bear }}\right],
$$

where $\mathbf{T}$ is the torque in $\mathrm{N} \cdot \mathrm{mm} ; \mathbf{d}$ is the diameter of the shaft in $\mathrm{mm} ; \mathbf{h}$ is the height of the key in $\mathrm{mm} ; \mathbf{t}_{\mathbf{1}}$ is the depth of the slot in the shaft; $\mathbf{l}_{\mathbf{d}}$ is the design length of the key in mm (for keys with round sides $\mathrm{l}_{\mathrm{d}}=1-\mathrm{b}$; for keys with square sides $l_{d}=1$, where $\mathbf{l}$ is the length of the key; $\mathbf{b}$ is the width of the key); [ $\left.\boldsymbol{\sigma}_{\text {bear }}\right]$ is the allowable bearing stress (for cast-iron hubs $\left[\sigma_{\text {bear }}\right]=60 \ldots 80 \mathrm{MPa}$; for steel hubs $\left.\left[\sigma_{\text {bear }}\right]=100 \ldots 120 \mathrm{MPa}\right)$.

Table 7.1

## Standard Sunk Keys

| Shaft diameter d | Key cross <br> section |  | Keyseat depth |  | Length 1 |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | b | h | shaft, $\mathrm{t}_{1}$ | hub, $\mathrm{t}_{2}$ |  |
| Over 17 to 22 | 6 | 6 | 3.5 | 2.8 | Over 14 to 70 |
| Over 22 to 30 | 8 | 7 | 4 | 3.3 | Over 18 to 90 |
| Over 30 to 38 | 10 | 8 | 5 | 3.3 | Over 22 to 110 |
| Over 38 to 44 | 12 | 8 | 5 | 3.3 | Over 28 to 140 |
| Over 44 to 50 | 14 | 9 | 5.5 | 3.8 | Over 36 to 160 |
| Over 50 to 58 | 16 | 10 | 6 | 4.3 | Over 45 to 180 |
| Over 58 to 65 | 18 | 11 | 7 | 4.4 | Over 50 to 200 |
| Over 65 to 75 | 20 | 12 | 7.5 | 4.9 | Over 56 to 220 |
| Over 75 to 85 | 22 | 14 | 9 | 5.4 | Over 63 to 250 |
| Over 85 to 95 | 25 | 14 | 9 | 5.4 | Over 70 to 280 |
| Over 95 to 110 | 28 | 16 | 10 | 6.4 | Over 80 to 320 |
| Over 110 to 130 | 32 | 18 | 11 | 7.4 | Over 90 to 360 |

Note: The length of the key is chosen according to the following series: 6 ; 8; 10; 12; 14; 16; 18; 20; 25; 28; 32; 35; 40; 45; 50; 56; 63; 70; 80; 90; 100; 110; 125; 140; 160; 180; 200.
